This treatment is composed of the following taxa: Chrysobalanaceae, *Acioa*, *Chrysobalanus*, *Couepia*, *Exelloidendron*, *Gaulettia*, *Hirtella*, *Hymenopus*, *Leptobalanus*, *Licania*, *Microdesmia*, *Moquilea*, *Parinari*, *Parinariopsis*.

HOW TO CITE

Sothers, C.A., Asprino, R.C., Barbosa-Silva, R.G., Prance, G.T. 2020. Chrysobalanaceae in **Flora do Brasil 2020**. Jardim Botânico do Rio de Janeiro. Available at: <http://floradobrasil.jbrj.gov.br/reflora/floradobrasil/FB85>.

DESCRIPTION

Trees, shrubs or subshrubs. Leaves simple, entire, alternate, the venation pinnate; stipules caducous to persistent, axillary or sometimes fused to petiole; lamina chartaceous or coriaceous, with lower surface glabrous, variously hairy or with distinct hair-filled stomatal cavities. Inflorescence racemose, paniculate or cymose; flowers bracteate and usually 2-bracteolate. Flowers actinomorphic to zygomorphic, bisexual, rarely polygamous or unisexual, markedly perigynous. Receptacle short to elongate, sometimes gibbous at base. Disc always present, forming a lining to the receptacle or an annular or shortly tubular structure at its mouth. Calyx lobes 5, imbricate, often unequal, erect or reflexed. Petals 4-5 or absent, commonly unequal, imbricate, usually caducous, rarely distinctly unguiculate. Stamens 2-100 (-300), inserted on margin or surface of disc, or basally adnate to it, forming a complete or almost circle, semi-circle or unilateral, all fertile or some without anthers and then often reduced to small staminodes; filaments filiform, free, connate at base or ligulately connate, included to far-exserted; anthers small, dorsifixed, longitudinally dehiscent, glabrous. Gynoecium of 1-3 carpels, gynobasic, usually with only 1 carpel fully developed, attached to base, middle or mouth of receptacle-tube, sessile or with a short gynophore, pubescent or villous. Carpel unilocular with 2 ovules or falsely bilocular with 1 ovule in each compartment. Style filiform, gynobasic; stigma distinctly or indistinctly 3-lobed. Ovules erect, epitropous, with micropyle directed towards base. Fruit a fleshy, or rarely dry, drupe; epicarp glabrous, hairy, smooth, verrucose or crustaceous; endocarp various, thick or thin, fibrous or bony, often with a special mechanism for seedling escape, often densely hairy inside. Seed erect, almost exalbuminous; cotyledons plano-convex, fleshy, sometimes ruminate.

COMMENTS

A family of ca. 545 species in 27 genera, of pantropical distribution. Brazil harbours ca. 270 species in 13 genera, occurring primarily in tropical lowland forests (Amazon and Atlantic coastal forests), and also present in secondary and dry forests, cerrado, campo rupestre, campina, savanna, and flooded forests. Chrysobalanaceae is distinguished from its sister clade (Balanopaceae, Dichapetalaceae, Euphoniaceae and Trigoniaceae) by the gynobasic style and silica in the wood.

Life Form

Shrub, Subshrub, Tree

Substrate

Terrestrial, Unknown

DISTRIBUTION

Native, Not endemic to Brazil

Phytogeographic Domains

Amazon Rainforest, Caatinga, Central Brazilian Savanna, Atlantic Rainforest

Vegetation Types

Anthropic area, Caatinga (stricto sensu), Amazonian Campinarana, Flooded Field (Várzea), Cerrado (lato sensu), Riverine Forest and/or Gallery Forest, Inundated Forest (Igapó), Terra Firme Forest, Inundated Forest (Várzea), Seasonally Semideciduous Forest, Ombrophylous Forest (Tropical Rain Forest), Mixed Ombrophylous Forest, Coastal Forest (Restinga), Amazonian Savanna, Rock outcrop vegetation

Geographic Distribution

Confirmed occurrences

North (Acre, Amazonas, Amapá, Pará, Rondônia, Roraima, Tocantins)

Northeast (Alagoas, Bahia, Ceará, Maranhão, Paraíba, Pernambuco, Piauí, Rio Grande do Norte, Sergipe)

Central-west (Distrito Federal, Goiás, Mato Grosso do Sul, Mato Grosso)

Southeast (Espírito Santo, Minas Gerais, Rio de Janeiro, São Paulo)

South (Paraná, Rio Grande do Sul, Santa Catarina)

Possible occurrences

North (Acre, Amazonas, Rondônia, Roraima, Tocantins)

Northeast (Maranhão)

Central-west (Distrito Federal, Goiás, Mato Grosso do Sul, Mato Grosso)

Southeast (Espírito Santo, Rio de Janeiro)

IDENTIFICATION KEY

1 Ovary bilocular, inserted laterally on wall or mouth of receptacle; stamens inserted unilaterally

2 Leaf lamina lower surface with reticulate venation, stomatal cavities or lanate (never glabrous); epicarp verrucose.....*Parinari*

2: Leaf lamina lower surface venation not reticulate, indistinct, without stomatal cavities, glabrous or with whitish pubescence; epicarp smooth.....*Exellodendron*

1: Ovary unilocular, inserted at base, laterally on wall or at mouth of receptacle; stamens inserted unilaterally, in a semi- or complete circle

3 Ovary inserted at base of receptacle

4 Petals absent; stamens (2–)3–19(–22)

5 Stamens exserted, always in a complete circle, 7–19(–22).....*Leptobalanus*

5: Stamens included, unilateral or less frequently in a complete circle, 2–11.....*Licania*

4: Petals present; stamens 5–90

6 Stamens included, equal to or sometimes slightly longer than calyx, 3–14

7 Leaf lower surface glabrous or hirsute; stamens 3–10.....*Hymenopus*

7: Leaf lower surface deeply reticulate or with stomatal cavities; stamens 8–14

.....*Microdesmia*

6: Stamens exserted (or less often equalling calyx), 11–45(–90)

8 Stamens 12–26; filaments partially fused in groups, pubescent. Fruit costate

.....*Chrysobalanus*

8: Stamens 11–90; filaments free almost to base, glabrous. Fruit not costate.....*Moquilea*

3: Ovary inserted at mouth of receptacle or laterally on wall of receptacle

9 Leaf lamina glabrous or hispid, without stomatal cavities. Bracts and bracteoles frequently com glandular. Stamens 3–9, inserted unilaterally.....*Hirtella*

9: Leaf lamina glabrous or pubescent, not hispid, or with stomatal cavities. Bracteoles not glandular. Stamens 12–300, unilateral or in a complete circle

10 Stamens exserted barely beyond calyx; ovary inserted laterally in mid receptacle

- *Parinariopsis*
- 10:** Stamens far-exserted; ovary inserted at mouth of receptacle
- 11** Leaf lamina with lanate pubescence, or hairs only between reticulations or within stomatal cavities, deeply reticulate, usually with stomatal cavities..... *Gaulettia*
- 11:** Leaf lamina lanate, tomentose, hirsute or glabrous, without stomatal cavities
- 12** Stamens free or united into a ligule for up to $\frac{1}{2}$ the length. Lamina glabrous. Calyx lobes with 2 glands on exterior..... *Acioa*
- 12:** Stamens free or sometimes united at base only. Lamina glabrous, lanate, tomentose, hirsute. Calyx lobes without glands on exterior..... *Couepia*

Has as synonym

homotype *Acia* Schreb.
homotype *Dulacia* Neck.

DESCRIPTION

Trees. Leaves: stipules intrapetiolar, persistent or caducous; petiole eglandular; lamina usually coriaceous, with 1 or 2 pairs of glands at base and smaller discoid glands; lower surface glabrous. Inflorescence a panicle or corymbose panicle with flattened axes, pendulous or upright. Bracteoles minute, persistent, eglandular. Flowers bisexual, strongly zygomorphic. Receptacle tube campanulate, obconic or turbinate. Sepals 5, glabrous outside except for the ciliolate margins, suborbicular, concave, unequal in size, 3 large, 2 small; 3 outer sepals with 1 or 2 large discoid glands towards the base. Petals 5, often with ciliate margin. Stamens 10-32, ligulately connate or free; staminodes absent or represented by minute denticulations or fimbriate on disc. Ovary 1-carpellary, 1-locular, inserted laterally at mouth of receptacle tube, glabrous or tomentose; style hairy at base or throughout, slightly 3-lobed at apex. Fruit a drupe 8 cm or more in length; epicarp smooth or verrucose, pericarp poorly differentiated into mesocarp and endocarp, thick, hard and fibrous, glabrous or lanate inside, on germination breaking up irregularly.

COMMENTS

Genus of six species, occurring in northern South America. An oil for cooking and soap-making is extracted from the seeds of *Acioa edulis*, *A. longipendula* and *A. dolichopoda*; the cotyledons are also eaten raw. These species are cultivated locally and more widely throughout the Amazon.

Acioa dolichopoda (Prance) Sothers & Prance

Has as synonym

basionym *Couepia dolichopoda* Prance

DESCRIPTION

Leaf: shape elliptic. **Flower:** receptacle campanulate; **stamen number** 16 - 21; **stamen free;** **stamen insertion** unilateral. **Fruit:** **epicarp** glabrous/smooth.

ADDITIONAL DESCRIPTION

Tree to 30 m . Branches glabrous when young. Leaves: stipules unknown; petioles 10-12 mm long, glabrous, shallowly canaliculate; lamina elliptic, coriaceous, 9-11.5 × 3.8-5.3 cm, cuneate at base, acuminate at apex with acumen 10-15 mm long, glabrous on both surfaces; midrib prominulous on both surfaces, glabrous; primary veins 6-8 pairs, almost plane on both surfaces. Inflorescences of pendulous panicles on long peduncles up to 75 cm; rachis and branches glabrous; branches small, numerous. Bracts and bracteoles 0.5-1.5 mm long, acute, glabrous except for the sparsely ciliate margins, subpersistent. Receptacle campanulate; tube 4-6 mm long, contracted into pedicels 10-15 mm long, glabrous within and without. Calyx lobes 5, rounded, unequal, with 2 longer than the other 3, sparsely puberulous when young; margins ciliate; exterior with 2 sessile conspicuous glands. Petals 5, glabrous, caducous, red. Stamens 16-21, unilateral, with c. 8 tooth-like staminodes opposite; filaments free and far exserted. Ovary sparsely villous. Style glabrous. Fruit obpyriform, 4.5 cm long × 3.5 cm wide at broadest point which is well below mid-point; exocarp smooth, glabrous; mesocarp thick, hard, fibrous; endocarp thin, bony.

COMMENTS

Fruits are edible and an oil is extracted from the seeds used for cooking. Also distributed in Peru and in Colombia, where it is extensively cultivated for its fruits.

Acioa edulis Prance

Has as synonym

homotype *Couepia edulis* (Prance) Prance

DESCRIPTION

Leaf: shape oblong. **Flower:** receptacle conical; **stamen number** 17 - 20; **stamen** free; **stamen insertion** semi circular. **Fruit:** epicarp glabrous/verrucose.

ADDITIONAL DESCRIPTION

Tree to 25 m tall. Trunk slightly buttressed to 0.5 m. Branches glabrous when young. Leaves: stipules linear, membranous, 5-8 mm long, glabrous, caducous; petioles 1.5-2.5 cm long, terete, glabrous; lamina oblong, thickly coriaceous, 7-17 × 4.5-12 cm, rounded at base, acuminate at apex with acumen 2-6 mm long, glabrous on both surfaces, with 2 glands near to base of lower surface; midrib prominulous above, prominent beneath; primary veins 9-11 pairs, prominent on both surfaces; secondary venation prominent on both surfaces. Inflorescences much-branched slightly corymbose panicles, 5-10 cm long; rachis and branches glabrous. Receptacle conical, slightly curved near base, 6-7 mm long, glabrous on exterior, with pilose hairs on interior below insertion of style and glabrous on other side; interior lined by an extremely thick disc with only a small hollow portion. Calyx lobes 5, rounded, unequal, 3-5 mm long, glabrous with 2 glands on exterior, with ciliate margins, appressed-puberulous on interior. Petals 5, pale lilac, caducous, glabrous, with ciliate margins. Stamens 17-20, inserted in 2 rows around 1/2 of the thick staminal ring, the other 1/2 of the ring with staminodes, with a circle of deflexed hairs inserted on interior at base of staminal ring; filaments glabrous, free. Ovary inserted at mouth of receptacle on the same side as stamens, glabrous on exterior, glabrous within, unilocular. Style inserted at base of ovary towards interior, equalling stamens in length; swollen base pilose; filamentous portion glabrous. Fruit ellipsoid, 6-7.5 cm long x 4-5 cm broad; exocarp glabrous, lenticellate; mesocarp 12-14 mm thick; endocarp thin, bony, fragile, glabrous within; cotyledons completely filling central cavity.

COMMENTS

The seeds are edible and eaten raw and are added to beiju (tapioca cakes). An oil is extracted and used for cooking and soap-making.

DESCRIPTION

Leaf: shape oblong/ovate. **Flower:** receptacle obconic/tubular; **stamen number** 10 - 12; **stamen** fused; **stamen insertion** unilateral. **Fruit:** epicarp glabrous/verrucose.

ADDITIONAL DESCRIPTION

Tree. Leaves: stipules caducous; petioles 5-12 mm long, 1.5-3 mm thick, glabrous, terete; lamina ovate to oblong, 7-17.5 × 3-8.3 cm, cuneate or slightly tapered at base, abruptly short-acuminate at apex, with acumen 2-5 mm long, glabrous on both surfaces; primary veins 7-9 pairs, inconspicuous on both surfaces. Inflorescences terminal and axillary panicles, with glabrous rachis and branches. Receptacle obconic-tubular, 10-30 mm long, glabrous on exterior, glabrous within except for deflexed hairs at throat. Calyx lobes 5, pubescent within. Petals 5, pale reddish-purple, with minutely serrate margins. Stamens unilateral, 10-12; filaments ligulately connate for at least half of length. Ovary inserted at mouth of receptacle, densely pilose. Style pilose on lower portion. Fruit ellipsoid; epicarp glabrous and sparsely lenticellate; mesocarp to 14 mm thick, fibrous; endocarp thick, hard, merging gradually into mesocarp, with thick fibres, lacking mechanism for seedling escape, glabrous within.

COMMENTS

Occurs in French Guiana as well as northern Brazil (AM, AP).

Acioa longipendula (Pilg.) Sothers & Prance

Has as synonym

basionym *Couepia longipendula* Pilg.

DESCRIPTION

Leaf: shape oblong-elliptic. **Flower:** receptacle turbinate; **stamen number** 32; **stamen** free; **stamen insertion** complete circular.
Fruit: epicarp smooth/indumentum.

ADDITIONAL DESCRIPTION

Tree 5-30 m tall. Leaves: stipules lanceolate, to 3 mm long, persistent; petioles 4-8 mm long, weakly canaliculate, glabrous; lamina oblong-elliptic, 6-16 × 3-7.5 cm, rounded to cuneate at base, caudately acuminate at apex with acumen 1-1.5 cm long, glabrous on both surfaces; primary veins 5-8 pairs, almost plane. Inflorescences pendulous panicles on long (to 60 cm) peduncles, mostly glabrous but sparsely pubescent towards apex. Bracts and bracteoles 1-3 mm long, apiculate, caducous. Receptacle turbinate, 10-15 mm long, with short light brown pubescence on exterior, completely glabrous within. Calyx lobes rounded, with 2 sessile glands on exterior. Petals 5, rose, caducous, ciliate on margins. Stamens c. 32, inserted in a nearly complete circle, with a few toothed staminodes interspersed on distal side opposite ovary. Ovary densely villous. Style glabrous, flattened at base. Fruit round to ellipsoid, 4-6 × 4 cm; epicarp with short sparse brown pubescence; pericarp hard, thick, fibrous, not differentiated, densely lanate within.

COMMENTS

The seeds are edible and an oil is extracted from the seeds. Widely cultivated in the region of Manaus and possibly elsewhere in Amazonia.

DESCRIPTION

Leaf: shape oblong-elliptic/elliptic. **Flower:** receptacle campanulate; **stamen number** 15; **stamen fused;** **stamen insertion** unilateral. **Fruit:** epicarp glabrous/verrucose.

ADDITIONAL DESCRIPTION

Tree. Leaves: stipules caducous (not seen); petioles 3-6 mm long, glabrous, thick; lamina broadly elliptic to oblong-elliptic, 8-16 × 4.5-8.5 cm, obtusely cordate at base, rounded to short-acuminate at apex, glabrous on both surfaces; primary veins inconspicuous. Inflorescences axillary and terminal panicles; rachis and branches glabrous. Bracts and bracteoles small; margins ciliolate. Receptacle broadly campanulate, gibbous, glabrous on exterior, glabrous within except for deflexed hairs at throat. Calyx lobes 5, glabrous on both surfaces except for ciliate margins. Petals 5, white; margins ciliate. Stamens c. 15, unilateral; filaments ligulately connate for half of length, with ligules 5 mm thick. Ovary pilose, inserted at mouth of receptacle. Style glabrous except for hirsute base. Fruit ovoid, 3.8 × 3 cm; exocarp glabrous, lenticellate.

homotype *Icaco* Plum. ex Adans.

DESCRIPTION

Shrubs or small to medium-sized trees. Leaves: stipules small, axillary, caducous; petiole eglandular; lower surface of lamina glabrous or with a few stiff, appressed hairs; 2 or more glands on lower surface. Inflorescence few-flowered, a short raceme of cymules or cymose throughout, or a false raceme, or a subsessile fascicle. Bracts small, eglandular. Flowers bisexual, actinomorphic. Receptacle-tube cupuliform, interior and exterior puberulous. Sepals 5, acute, subequal. Petals 5, longer than the sepals. Stamens 12-26, forming a complete circle; filaments hairy, approximately twice as long as sepals, slightly united into groups at the base. Ovary monocarpellary, 1-locular, inserted at base of receptacle-tube, covered with a dense mass of hairs; style puberulous; stigma slightly expanded, shallowly 3-lobed. Drupe small, glabrous; endocarp thin, hard, interior glabrous and exterior smooth, with 4-8 prominent longitudinal ridges corresponding to the lines of fracture that allow seedling to escape.

COMMENTS

Genus of three species, of which two occurring in Brazil.

Life Form

Shrub, Tree

Substrate

Terrestrial

DISTRIBUTION

Native, Not endemic to Brazil

Phytogeographic Domains

Amazon Rainforest, Atlantic Rainforest

Vegetation Types

Ombrophylous Forest (Tropical Rain Forest), Coastal Forest (Restinga)

Geographic Distribution

Confirmed occurrences

North (Amazonas, Amapá, Pará)

Northeast (Alagoas, Bahia, Ceará, Maranhão, Paraíba, Piauí, Rio Grande do Norte, Sergipe)

Southeast (Espírito Santo, Rio de Janeiro, São Paulo)

IDENTIFICATION KEY

1 Inflorescence usually with 7 or more sessile or subsessile flowers; receptacle-tube and sepals grey-tomentellous outside; leaves orbicular to lanceolate-acuminate.....*C. icaco*

1: Inflorescence with 1-5 flowers terminating in a stalk 0.4-0.6 cm long with 2 conspicuous bracteoles; receptacle-tube and sepals ferrugineous outside; leaves elliptic to oblong.....*C. prancei*

Chrysobalanus icaco L.

This treatment is composed of the following taxa: *Chrysobalanus icaco*, *Chrysobalanus icaco* subsp. *icaco*.

DESCRIPTION

Leaf: shape orbicular/ovate elliptic. **Inflorescence:** type cymule. **Flower:** receptacle shape cupuliform; filament fusion fused basally; **stamen number** 12 to 26. **Fruit:** epicarp glabrous/smooth/ridge.

ADDITIONAL DESCRIPTION

Shrub or small tree to 5 m tall. Branches glabrous and lenticellate. Leaves: stipules deciduous, 1-3 mm long; petioles 2-4 mm long; lamina orbicular to ovate-elliptic, 2.8 × 1.2-6 cm, retuse, rounded or with a short blunt acumen not exceeding 2 mm at apex, subcuneate at base, glabrous on both surfaces; primary veins inconspicuous. Inflorescences small terminal and axillary cymules with grey-brown tomentum. Receptacle cupuliform, tomentose on interior and exterior. Calyx lobes 5, rounded to acute. Petals exceeding calyx lobes, white, glabrous. Stamens 12-26; filaments joined for part of their length in small groups, densely hairy. Ovary pilose. Fruit ovate to obovate, 1.8-5 cm long; epicarp smooth with longitudinal ridges; mesocarp thin and fleshy; endocarp thin and hard with smooth, ridged exterior.

Has as synonym

basionym *Chrysobalanus venezuelanus* Prance

DESCRIPTION

Leaf: shape oblong-elliptic. **Inflorescence:** type cymule. **Flower:** receptacle shape campanulate; **filament fusion** free; **stamen number** 14 to 15. **Fruit:** epicarp glabrous/costate.

ADDITIONAL DESCRIPTION

Tree, 10 m tall. Branches sparsely puberulous to glabrescent when young. Leaves: stipules caducous, membranous, axillary; petioles 2-4 mm long, terete, rugulose, glabrous; lamina oblong-elliptic, coriaceous, 5.5-11 × 2.2-4.2 cm, cuneate at base, caudate at apex; acumen 10-17 mm long; glabrous and shiny above, glabrous beneath except for appressed hairs on midrib and primary veins of lower surface of very young leaves; midrib prominulous above, prominent beneath; primary veins 6-8 pairs, prominulous on both surfaces. Inflorescences of few-flowered cymules, rachis to 5 cm long; rachis and branches ferrugineous-pubescent; bracts and bracteoles ovate, membranous, puberulous on exterior, c. 1 mm long, caducous. Flowers 3 mm long, in small cymules. Receptacle campanulate, tomentellous on exterior, tomentose within; calyx lobes rounded, tomentellous. Petals 5, ovate, glabrous. Stamens 14 or 15, inserted around complete circle; filaments shortly exserted, pubescent. Ovary inserted at base of receptacle, lanate; style equalling filaments in length. Fruit oblong, costate; exocarp glabrous except when young.

DESCRIPTION

Trees or shrubs. Leaves: stipules subulate or deltate, persistent or sub-persistent; petiole eglandular; lamina often with 1 or 2 pairs of glands at base and sometimes with several small marginal glands especially near apex; lower surface of lamina glabrous or with arachnoid indumentum. Inflorescence a panicle, spike or raceme, rarely flowers solitary. Pedicels usually shorter than receptacle tube. Bracts and bracteoles usually persistent, sometimes enclosing flower-buds in small groups, eglandular. Flowers bisexual, zygomorphic. Receptacle tube campanulate to narrowly cylindrical, often slightly curved, ventricose, rarely longer than the calyx, interior hollow, usually glabrous inside except at throat, less often hairy within; receptacle disc well developed. Sepals 5, subequal, spreading or reflexed, acute or rounded, usually eglandular. Petals 5, white, caducous, ± equalling sepals, orbicular to lingulate, sometimes shortly unguiculate. Stamens 20-300, rarely less than 15; filaments inserted on abaxial surface of disc, usually forming a complete circle, less frequently unilateral, shortly to far-exserted, but not much longer than the combined length of calyx and receptacle tube; staminodes absent or short and filiform. Ovary 1 (2 or 3)-carpellary, 1-locular, inserted laterally at mouth of receptacle tube; style filiform, far-exserted, indistinctly 3-lobed at apex, hairy for greater part of length. Fruit a drupe 2.5-12 cm or more long; endocarp hard, granular, shortly hairy inside, on germination breaking up irregularly, surface without longitudinal channels, rough and irregular owing to fusiform anticlinal aggregations of stone cells and fibres which penetrate the mesocarp ±deeply.

COMMENTS

Genus with ca. 64 species in the Neotropics, widely distributed from Mexico, Central America, throughout South America to southern Brazil and Paraguay. In Brazil the genus is represented by 54 species occurring in almost all the states, but with the greatest diversity in Amazonia.

IDENTIFICATION KEY

- 1 Inflorescence a raceme or spike
- 2 Leaves prominently reticulate beneath, with conspicuous parallel primary veins; exocarp often tomentellous
- 3 Inflorescence grey puberulous; leaf venation only prominulous; fruit exterior glabrous and smooth **C. bernardii**
- 3: Inflorescence densely ferrugineous; leaf venation prominent; fruit exterior verrucose or tomentose
- 2: Leaves not prominently reticulate beneath; fruit exocarp always glabrous, smooth or verrucose
- 4 Bracteoles persistent, and at least 3/4 the length of receptacle or more than 10 mm long
- 5 Flowers not more than 4 mm long **C. spicata**
- 5: Flowers 6 mm long or more
- 6 Flowers 16-75 mm long; stamens more than 50; leaves 14-26 cm long
- 7 Primary leaf veins distinctly anastomosing at margins to form a marginal vein; leaf base rounded to subcordate; receptacle subcylindrical or tubular, 30-50 mm long
- 8 Flowers 16-18 mm long; receptacle subcylindrical, glabrous except for reflexed hairs at apex; stipules to 15 mm long, caducous **C. insignis**
- 8: Flowers 60-75 mm long; receptacle tubular, tomentose within almost to base; stipules 20-35 mm long, persistent
- **C. cidiana**
- 7: Primary leaf veins not anastomosing; leaf base cuneate to rounded; receptacle tubular, 12-15 mm long **C. bondarii**
- 6: Flowers 6-12 mm long; stamens 15-28; leaves 6-18 cm long **C. habrantha**
- 4: Bracteoles caducous or less than 1/2 the length of receptacle, under 10 mm long
- 9 Stamens less than 40
- 10 Receptacle subcylindrical, densely ferrugineous-sericeous
- 11 Leaves narrowly oblong, 7-10 cm long, 2-3.3 cm broad, glabrous beneath; receptacle light-brown on exterior; stamens c. 35
- **C. carauteae**
- 11: Leaves broadly oblong, 12-24 cm long, 4.5-8.5 cm broad, ferrugineous-lanate-pubescent beneath; receptacle ferrugineous on exterior; stamens c. 25 **C. magnoliifolia**
- 10: Receptacle cylindrical, with sparse appressed pubescence only
- 12 Leaves obovate, 2.5-10 cm long, bluntly acuminate; bracteoles persistent or subpersistent; stamens in a complete circle **C. obovata**
- 12: Leaves oblong-lanceolate, 9-15 cm long, with a long acumen; bracteoles caducous; stamens unilateral
- **C. guianensis**
- 9: Stamens numerous (more than 60)
- 13 Receptacle glabrous or with sparse appressed grey tomentum on exterior
- 14 Leaves 9-17 cm long, densely appressed-lanate pubescent beneath; primary veins 12-15 pairs... **C. williamsii**
- 14: Leaves 5-8 cm long, sparsely pubescent beneath; primary veins 7-10 pairs..... **C. marleneae**
- 13: Receptacle with dense brown pubescence on exterior
- 15 Leaves oblong-lanceolate..... **C. krukovi**

- 15:** Leaves oblong to oblong-elliptic
16 Primary veins 24-30 pairs.....*C. macrophylla*
16: Primary veins 16-20 pairs
17 Leaf apex with prominent well-developed acumen.....*C. chrysocalyx*
17: Leaf apex rounded to bluntly acuminate.....*C. latifolia*
1: Inflorescence a panicle
18 Bracts and bracteoles persistent at flowering, at least 1/2 as long as receptacle
19 Flowers 20-25 mm long; exterior of receptacle and calyx lobes with a long ferruginous sericeous pubescence; leaves glabrous (rarely glabrescent) beneath*C. eriantha*
19: Flowers 7-20 mm long; exterior of receptacle shortly brown- to greytomentose; leaves arachnoid-pubescent beneath
20 Leaves thick and coriaceous; bracteoles always persisting through flowering; rachis of inflorescence and receptacle longitudinally striate, or if not, petioles 13-18 mm long
21 Flowers 7-15 mm long; leaf bases subcordate, rarely rounded; rachis and receptacle with longitudinal striations*C. bracteosa*
21: Flowers 18-22 mm long; leaf bases rounded to subcuneate; rachis and receptacle not longitudinally striate*C. belemii*
20: Leaves thin and membranous; bracteoles persistent only in bud; rachis and receptacle not longitudinally striate; petioles 4-8 mm long
22 Stamens connate at base for at least 1 mm; receptacle tapering to base, subturbinate.....*C. trapezioana*
22: Stamens free almost to base; receptacle subcylindrical.....*C. subcordata*
18: Bracts and bracteoles not persistent at flowering, or small and inconspicuous
23 Interior of receptacle filled with hairs to base
24 Primary veins 10-15; exterior of receptacle and calyx lobes with sparse appressed pubescence not completely covering surface*C. paraensis*
24: Primary veins 17-28; exterior of receptacle and calyx lobes densely pubescent, completely covering surface
25 Petioles canaliculate above; flowers 12-17 mm long; exterior of receptacle and calyx lobes with short brown pubescence; stamens 38-40.....*C. excelsa*
25: Petioles not canaliculate; flowers 8-12 mm long; exterior of receptacle and calyx lobes with sparse short grey pubescence; stamens 20-35*C. caryophylloides*
23: Interior of receptacle glabrous except for deflexed hairs at throat
26 Leaf lower surface completely glabrous; exterior of receptacle usually almost glabrous
27 Peduncles elongated (30-80 cm long); exterior of calyx lobes with 2 sessile glands
27: Peduncles short (less than 10 cm long); exterior of calyx lobes eglandular
28 Stamens 9-11*C. joaquiniae*
28: Stamens 25-110
29 Leaves oblong to oblong-lanceolate, prominently acuminate; inflorescence little-branched, almost racemose; petioles 8-12 mm; stamens c. 110.....*C. glabra*
29: Leaves ovate to elliptic, bluntly acuminate; inflorescence much branched; petioles 4-7 mm; stamens 25-45*C. paraensis*
26: Leaf lower surface lanate; exterior of receptacle pubescent
30 Exterior of receptacle and calyx lobes sparsely appressedpuberulous, the pubescence not forming a complete covering
31 Stipules persistent, adnate to the base of petiole; rachis of inflorescence 3-5 mm thick; petal margins glabrous*C. stipularis*
31: Stipules caducous, not adnate to base of petiole; rachis of inflorescence 1-2.5 mm thick; petal margins ciliate
32 Leaf lower surface with distinct, prominulous, parallel secondary venation at 90° to primary veins*C. bernardii*
32: Leaf lower surface densely lanate-pubescent and smooth, venation obscured beneath pubescence
33 Leaves bluntly or shortly acuminate to obtuse; receptacle subcampanulate, 3-5 mm thick at top; inflorescence a much-branched panicle
34 Leaves ovate to oblong, 2.5-8.5 cm broad.....*C. paraensis*
34: Leaves oblong-lanceolate, 1.5-4 cm broad.....*C. maguirei*
33: Leaves prominently acuminate; receptacle cylindrical, c. 2 mm thick at top; inflorescence often with only short 2-3 flowered branches
35 Inflorescences erect, much-branched, predominantly terminal panicles.....*C. guianensis*
35: Inflorescences little-branched racemose panicles, axillary or predominantly axillary, but with a small terminal branch
36 Inflorescences single racemose reflexed panicles; bracteoles persistent.....*C. reflexa*
36: Inflorescences erect, terminal and in the upper 2-6 axils; bracteoles caducous*C. guianensis*
30: Exterior of receptacle and calyx lobes with dense pubescence forming a complete covering
37 Leaves 4-7 cm long; chartaceous; flowers 5-6 mm.....*C. pernambucensis*

- 37:** Leaves 2-6 cm long; coriaceous; flowers 9-11 mm.....*C. oxossii*
- 38** Exterior of receptacle and calyx lobes grey-puberulous; primary leaf veins 18-23, slightly impressed above
.....*C. impressa*
- 38:** Exterior of receptacle and calyx lobes brown-tomentose; primary leaf veins 12-14, plane above
.....*C. multiflora*
- 39** Outer surface of petals distinctly pubescent
- 40** Leaves 2.5-5.5 cm long; primary veins 5-9
- 41** Leaves oblong-lanceolate to oblong; acumen 5-7 mm long; base cuneate; petioles 5-7 mm long.*C. parvifolia*
- 41:** Leaves orbicular to elliptic; acumen 0-3 mm long; base rounded to cordate; petioles 2 mm long.....*C. uitii*
- 40:** Leaves (4-)6-16 cm long; primary veins 9-17
- 42** Flowers 6-12 mm long; receptacle cylindrical, c. 2 mm thick at top below calyx lobes
- 43** Inflorescence and flowers densely ferruginous-sericeous; flowers 8-12 mm long; petioles 5-10 mm long; receptacle not striate on exterior*C. meridionalis*
- 43:** Inflorescence and flowers with short grey pubescence; flowers 6-8 mm long; petioles 3-7 mm long; exterior of receptacle longitudinally striate.....*C. ulei*
- 42:** Flowers 12-20 mm long; receptacle subcampanulate, 4-6 mm thick
- 44** Pedicels 6-15 mm long; exterior of receptacle and calyx lobes short grey-sordid-puberulent....*C. cataractae*
- 44:** Pedicels up to 6 mm in length; exterior of receptacle and calyx lobes spreading brown-tomentose.*C. venosa*
- 45** Leaves oblong to ovate; stamens 50-125.....*C. grandiflora*
- 45:** Leaves elliptic to narrowly elliptic; stamens 35-40.....*C. brevistaminea*
- 39:** Petals glabrous except for ciliate margins
- 46** Receptacle cylindrical or subcylindrical
- 47** Inflorescence of densely clustered glomerules.....*C. coarctata*
- 47:** Inflorescence a loosely branched panicle
- 48** Stamens c. 35; leaf base subcordate to rounded.....*C. subcordata*
- 48:** Stamens 15-28; leaf base rounded to cuneate
- 49** Primary leaf veins 8-14 pairs; petioles terete or canaliculate; stamens around partial or complete circle
- 50** Flowers borne on distinctly articulated pedicels with lower part of pedicel persistent after fall of some flowers*C. monteclarensis*
- 50:** Pedicels not conspicuously articulated and no part remaining after flower fall
- 51** Leaves 4.5-9.5 × 2-3.5 cm; base cuneate, subcuneate, equal; petioles 4-6 mm*C. sandwithii*
- 51:** Leaves 9-17 × 3.5-7.5 cm; base rounded, unequal; petioles 8-11 mm*C. leitaofilhoi*
- 49:** Primary leaf veins 14-19 pairs; petioles canaliculate; stamens always around complete circle
- 52** Bracteoles 3-15 mm, enclosing young buds; leaf acumen 5-12 mm*C. morii*
- 52:** Bracteoles 1-35 mm, not enclosing young buds; leaf acumen 3-5 mm*C. trapezioana*
- 46:** Receptacle broadly campanulate or turbinate
- 53** Stamens 14-20
- 54** Leaves ovate, 4-9 cm long; primary veins 11-15; flowers 8-12 mm long; petioles 4-8 mm long.....*C. ovalifolia*

Couepia belemii Prance

DESCRIPTION

Leaf: shape oblong-elliptic/oblong; **indumentum** pubescent/arachnoid. **Inflorescence:** type panicle. **Flower:** receptacle shape campanulate; **stamen number** 25 - 45; **filament fusion** free. **Fruit:** epicarp unknown.

ADDITIONAL DESCRIPTION

Trees, medium sized. Branches glabrous when young, rugose. Leaves: stipules caducous (not seen); petioles 13-20 mm long, glabrescent, rugose, weakly canaliculate; lamina oblong to oblong-elliptic, 11-18 × 4-7 cm, acuminate at apex with acumen 4-8 mm long, rounded to subcuneate at base, glabrous above, densely lanate-arachnoid pubescent beneath; midrib prominent and glabrous above, prominent beneath; primary veins 18-24 pairs, plane above, prominent beneath. Inflorescences of terminal panicles; rachis and branches ferrugineoustomentose. Receptacle subsessile, campanulate, 8-14 mm long, densely tomentose on exterior, glabrous within except for ring of deflexed hairs around throat. Calyx lobes acute, 7-10 mm long, tomentose on exterior. Petals 5, white, with ciliate margins. Stamens c. 30, inserted around complete circle. Ovary lanate-pilose. Style tomentose. Fruit not seen.

Couepia bernardii Prance

DESCRIPTION

Leaf: shape elliptic; **indumentum** pubescent/lanate. **Inflorescence:** type panicle. **Flower:** receptacle shape cylindric; **stamen number** 14 - 30; **filament fusion** free. **Fruit:** epicarp glabrous/smooth.

ADDITIONAL DESCRIPTION

Trees. Branches puberulous when young, soon becoming glabrous. Leaves: stipules linear-lanceolate, tomentellous, to 6 mm long, caducous; petioles 4-7 mm long, tomentellous, becoming glabrous with age, rugulose, canaliculate above, eglandular; lamina elliptic, chartaceous, 9-16 × 3.5-6.5 cm, rounded to subcuneate at base, apiculate at apex with acumen 2-8 mm long, glabrous above, with a short appressed-lanate caducous pubescence beneath; midrib prominent on both surfaces; primary veins 12-14 pairs, plane above, prominent beneath; secondary venation prominulous, more or less parallel and 90° to primary veins. Inflorescences of terminal and axillary little-branched panicles with central rachis and short 2-3 flowered branches, or of racemes; rachis and branches puberulous. Receptacle cylindrical 7-8 mm long, sparsely grey-puberulous externally, glabrous within except for deflexed hairs at throat; pedicels c. 1 mm long. Calyx lobes 5, rounded, 2.5 mm long, puberulous externally. Petals 5, white; margins ciliate. Stamens 20-23, unilateral, with arc of circle opposite to them toothed. Ovary tomentose. Style pubescent on lower portion only. Fruit ovoid, c. 5 cm long × 4 cm broad; exocarp hard and smooth or crustaceous when dry, glabrous; mesocarp woody, 6-10 mm thick when dry; endocarp thin, bony, glabrous within.

Couepia bondarii Prance

DESCRIPTION

Leaf: shape oblong/lanceolate; **indumentum** pubescent/arachnoid. **Inflorescence:** type raceme. **Flower:** receptacle shape cylindric; **stamen number** more than 60; **filament fusion** fused basally. **Fruit:** epicarp glabrous/smooth.

ADDITIONAL DESCRIPTION

Trees, small. Branches glabrous when young. Leaves: stipules lanceolate, membranous, to 30 mm long, caducous; petioles 6-10 mm long, terete, tomentellous; lamina oblong-lanceolate, 15-25 × 3.5-7 cm, acuminate at apex with acumen c. 5 mm long, subcuneate at base, glabrous above, densely rufous-brown-arachnoid pubescent beneath; midrib slightly prominent and glabrous above; primary veins 17-25 pairs, plane above, prominent beneath. Inflorescences of terminal and axillary fasciculate racemes; rachis ferrugineous-tomentellous. Bracts and bracteoles large, ovate, persistent, to 25 mm long, densely brown-puberulous on exterior, sparsely puberulous within. Flowers 20-30 mm long. Receptacle tubular, sessile, 12-15 mm long, rufous-tomentellous on exterior, glabrous within except for ring of deflexed hairs around throat. Calyx lobes acute, rufous-tomentellous, 10-16 mm long. Petals 5, sericeous on outer surfaces. Stamens c. 65, inserted around complete circle, connate at base for 1.5 mm. Ovary pilose. Style tomentose. Fruit ellipsoid, 7 × 4.5 cm; exocarp smooth, glabrous; mesocarp c. 4 mm thick when dry; endocarp thin, bony, glabrous within.

Couepia bracteosa Benth.

This treatment is composed of the following taxa: *Couepia bracteosa*, .

Has as synonym

homotype *Moquilea bracteosa* (Benth.) Walp.
heterotypic *Couepia bracteosa* var. *grandifolia* Benoist
heterotypic *Couepia bracteosa* var. *minor* Ducke
heterotypic *Moquilea rufa* Barb.Rodr.

DESCRIPTION

Leaf: shape elliptic/ovate; **indumentum** lanate. **Inflorescence:** type panicle. **Flower:** receptacle shape cylindric; **stamen number** 25 - 45; **filament fusion** fused basally. **Fruit:** epicarp glabrous/verrucose/smooth.

ADDITIONAL DESCRIPTION

Trees to 20 m tall, usually smaller. Leaves: stipules 1.5-3.5 mm long, subulate, deciduous; petioles 8-18 mm long, sparsely pubescent, shallowly canaliculate; lamina ovateelliptic, 8-22 × 4-9.5 cm, subcordate at base, short-acuminate at apex, glabrous above, grey to brown-lanate beneath; primary veins 12-25 pairs, prominent beneath. Inflorescences terminal panicles with short silver-grey pubescence. Bracts ovate, often exceeding the receptacle tube, enclosing small groups of buds, 7-12 mm long, persistent. Receptacle subsessile, cylindrical, 7-12.5 mm long, densely brown-pubescent on exterior, glabrous within except for deflexed hairs at throat. Calyx lobes acute. Petals 5, white, sparsely ciliate on margins. Stamens 25-40, connate at base of filaments, inserted in an arc of 270°, with a few short filamentous staminodes opposite. Ovary densely villous. Style pubescent. Fruit globose, 8 × 7 cm; epicarp verrucose or smooth; mesocarp thick, fleshy; endocarp thin, rather fragile, granular, glabrous within.

COMMENTS

Cultivated extensively for its edible fruits.

Couepia brevistaminea Barbosa-Silva & Antar

DESCRIPTION

Leaf: shape elliptic/ovate/oblong; **indumentum** indumentum/lanate. **Inflorescence:** type panicle. **Flower:** receptacle shape cylindric; **stamen number** 25 - 45; **filament fusion** free. **Fruit:** epicarp unknown.

ADDITIONAL DESCRIPTION

Shrub to 1.50 m tall. Branches when young brownish, farinaceous-lanate to glabrescent. Leaves: stipules linear, 7–13 mm, often persistent; petiole 3–6 mm long, eglandular; lamina coriaceous, elliptic to narrow-elliptic, rarely oblong or ovate, base rounded or cuneate, apex acute, apiculate, rarely acuminate, 4.2–10.0 × 2.4–4.5 cm, 11–13 pairs of secondary veins; lower surface of lamina with two glands at base near to petiole, glands scattered along midrib, densely farinaceous-lanate, midrib prominent, secondary veins slightly prominent, tertiary veins and reticulation indistinct.

Inflorescence a terminal or sub-terminal panicle, rachis strigose; bracts and bracteoles triangular, strigose, 4 mm long, caducous; pedicel ca. 3–3.5 mm long. Flowers ca. 13 mm long; receptacle cylindrical, strigose outside, inside glabrous except for deflexed hairs near throat; calyx lobes 5, ovate, margin eglandular, rarely with small sessile glands; petals 5, ciliate margin, white; stamens 35–40, inserted in a complete circle, filaments 10–12 mm long, glabrous; ovary inserted laterally at mouth of receptacle, lanate; style hirsute up to 3/5 of length, stigma truncate. Fruit unknown.

Couepia carauteae Prance

DESCRIPTION

Leaf: shape oblong; **indumentum** glabrous. **Inflorescence:** type raceme. **Flower:** **receptacle shape** subcylindrical; **stamen number** 25 - 45; **filament fusion** free. **Fruit:** **epicarp** unknown.

ADDITIONAL DESCRIPTION

Trees to 22 m tall. Branches glabrous when young. Leaves: stipules linear, to 1 mm long, subpersistent; petioles 6-10 mm long, glabrous, rugulose, terete; lamina narrowly oblong, coriaceous, 7-10 × 2-3.3 cm, subcuneate at base, acuminate at apex with acumen 4-7 mm long, finely pointed, glabrous above, glabrous and waxy beneath; midrib prominent above, prominent and almost glabrous beneath, with only a few short stiff hairs; primary veins 16-20 pairs, plane above, prominent beneath. Inflorescences terminal and subterminal racemes; rachis densely yellow-brown sericeous-tomentose. Bracteoles ovate, 6-7 mm long, tomentose on exterior, caducous. Receptacle subcylindrical, 7-8 mm long, yellow-brown sericeous on exterior, glabrous within; pedicels 0.5 mm long. Calyx lobes 5, acute. Petals 5, glabrous on exterior; margins ciliate. Stamens c. 35, inserted around complete circle, filaments exserted. Ovary pilose. Style densely hirsute to apex. Fruit not seen.

Couepia caryophylloides Benoist

This treatment is composed of the following taxa: *Couepia caryophylloides*, *Couepia caryophylloides* subsp. *caryophylloides*, *Couepia caryophylloides* subsp. *glabra*.

DESCRIPTION

Leaf: shape oblong-elliptic/oblong/lanceolate; **indumentum** arachnoid. **Inflorescence:** type panicle. **Flower:** receptacle shape subcylindrical; **stamen number** 25 - 45; **filament fusion** free. **Fruit:** epicarp glabrous/smooth.

ADDITIONAL DESCRIPTION

Trees to 25 m tall. Leaves: stipules c. 2 mm long, caducous; petioles 7-9 mm long, canaliculate above, glabrous or sparsely pubescent; lamina oblong-elliptic to oblong-lanceolate, 10-21 × 4-7.5 cm, rounded at base, acuminate at apex with acumen 4-10 mm long, glabrous above, densely grey-brown-arachnoid beneath; primary veins 17-25 pairs, prominent beneath; midrib glabrous above. Inflorescences dense terminal or axillary panicles 4-6 cm long; rachis and branches densely grey-pubescent. Bracts and bracteoles ovate, to 8 mm long, early caducous. Receptacle subcylindrical 5-7 mm long, longitudinally ridged when dry, with short grey pubescence on exterior; interior lined by dense reflexed hairs to base, or confined to ring at throat; pedicels 1-3 mm long. Calyx lobes rounded, ovate, 3-4 mm long. Petals 5, white, ciliate on margins. Stamens 22-35, inserted in a semicircle, with a toothed ridge of staminodes opposite. Ovary villous. Style pubescent almost to apex. Fruit round to oval; epicarp smooth, glabrous; mesocarp thin, fleshy; endocarp granular, fragile, glabrous within.

Couepia cataractae Ducke

DESCRIPTION

Leaf: shape oblong; **indumentum** glabrous/arachnoid. **Inflorescence:** type panicle. **Flower:** **receptacle shape** campanulate/turbinate; **stamen number** more than 60; **filament fusion** free. **Fruit:** **epicarp** glabrous/verrucose.

ADDITIONAL DESCRIPTION

Shrubs or small trees. Leaves: stipules linear, to 1.5 mm long, membranous, deciduous; petioles 3-5 mm long, sparsely pubescent, canaliculate above; lamina oblong, 4-10 × 1.5-5 cm, rounded to subcordate at base, rounded to obtuse at apex, glabrous above, densely greyarachnoid beneath, usually becoming glabrous with age; primary veins 10-15 pairs, rather inconspicuous beneath; midrib prominent beneath, glabrous above except at base. Inflorescences terminal and axillary panicles; rachis and branches with short dense grey pubescence. Bracts and bracteoles 1.5-5 mm long, ovate, deciduous. Receptacle 5-7 mm long, subcampanulate-turbinate, often slightly curved anteriorly, short grey-pubescent on exterior, glabrous within except for deflexed hairs at throat; pedicels slender, 6-13 mm long. Calyx lobes rounded. Petals 5, white, pubescent, ciliate on margins. Stamens 60-90, inserted in a complete circle; filaments very far exserted. Ovary pilose. Style pubescent for 3/4 its length. Fruit ovoid, with a verrucose epicarp; mesocarp thin; endocarp thin, fragile, granular, sparsely pubescent within.

Couepia chrysocalyx (Poepp. & Endl.) Benth. ex Hook. f.

Has as synonym

basionym *Moquilea chrysocalyx* Poepp.

DESCRIPTION

Leaf: shape oblong; **indumentum** arachnoid. **Inflorescence:** type raceme. **Flower:** receptacle shape cylindric; **stamen number** more than 60; **filament fusion** free. **Fruit:** epicarp glabrous/verrucose/smooth.

ADDITIONAL DESCRIPTION

Trees to 10 m tall. Leaves: stipules to 7 mm long, linear, caducous; petioles 4-7 mm long sparsely pubescent, terete, with 2 sessile glands near base of lamina; lamina oblong, 10-22 × 4-8.5 cm, rounded to cuneate at base, acuminate at apex with acumen 2-12 mm long, glabrous above (or with sparse appressed pubescence when very young), densely silver-grey arachnoid beneath; primary veins 15-20 pairs, prominent beneath. Inflorescences short densely-flowered axillary corymbose racemes; rachis with short reddish-brown pubescence. Bracts and bracteoles 1.5-3.5 mm long; deciduous. Receptacle cylindrical, slightly curved, 9-14 mm long, with short reddish-brown pubescence on exterior, glabrous within except for deflexed hairs at throat, with thick walls leaving the cavity small; pedicels 2-3 mm long. Calyx lobes rounded. Petals 5, white, sparsely ciliate or glabrous on margins. Ovary densely villous. Style densely villous almost to apex. Stamens c. 100, inserted in a complete circle; filaments far exserted, forming a dense tangled mass. Fruit globose to oblong, to 9 cm long; epicarp verrucose or smooth, glabrous; mesocarp thick, fleshy; endocarp thick, fragile, granular-fibrous, glabrous within.

Couepia cidiana Prance

DESCRIPTION

Leaf: shape oblong/lanceolate; **indumentum** tomentose/lanate. **Inflorescence:** type raceme. **Flower:** receptacle shape cylindric; **stamen number** more than 60; **filament fusion** fused basally. **Fruit:** epicarp unknown.

ADDITIONAL DESCRIPTION

Treelets 8-10 m tall. Branches tomentose when young. Leaves: stipules linear, membranous, 2-2.5 cm long, persistent; petioles 5-7 mm long, terete, eglandular, densely tomentose; lamina oblong-lanceolate, coriaceous, 15-26 × 7-9.5 cm broad, subcordate at base, acuminate at apex with acumen 7-10 mm long, glabrous above, densely grey short-lanate beneath with contrasting brown-tomentose venation; midrib prominulous above, tomentellous when young; primary veins 26-35 pairs, lightly impressed above, prominent and tomentose beneath, anastomosing c. 3 mm from margin to form a conspicuous marginal vein; secondary veins ±parallel, prominulous. Inflorescences few-flowered racemes; rachis tomentose. Bracts and bracteoles persistent, 2-3.6 cm long, tomentose on exterior, glabrous within, ovate, acuminate. Flowers 60-75 mm long. Receptacle cylindrical, 3-4 cm long, densely velutinous tomentellous on exterior, tomentose within to base, sessile. Calyx lobes 5, triangular, acute, tomentose on exterior, tomentose within except for glabrous lower portion, 10-13 mm long. Petals 5, white, glabrous on exterior; margins ciliate. Stamens c. 165, inserted around a complete circle, fused at base to form a ring c. 5 mm tall with stamens inserted in several rows on exterior of ring; interior of ring densely tomentose. Ovary inserted near mouth of tube, densely villous. Style sparsely hirsute pubescent on lower 1/3. Fruit not seen.

Couepia coarctata Prance

DESCRIPTION

Leaf: shape oblong-elliptic/oblong; **indumentum** arachnoid. **Inflorescence:** type panicle. **Flower:** receptacle shape cylindric; **stamen number** 14 - 30; **filament fusion** free. **Fruit:** epicarp glabrous/smooth.

ADDITIONAL DESCRIPTION

Trees to 6 m tall. Branches sparsely puberulous when young, soon becoming glabrous and lenticellate. Leaves: stipules 1-2 mm long, ovate, membranous, caducous; petioles 6-10 mm long, lanate, with 2 glands at base (visible in young petioles only), becoming rugulose with age; lamina oblong to oblong-elliptic, thickly coriaceous, 6-13 × 3.5-5.5 cm, subcordate to rounded at base, rounded at apex, acute or bluntly acuminate, glabrous and lustrous above, densely velutinous-arachnoid ferruginous beneath; midrib slightly impressed above, prominent and lanate beneath; primary veins 9-13 pairs, impressed above, prominent beneath. Inflorescences of terminal densely crowded panicles with many short branches only; rachis and branches puberulous. Bracts and bracteoles small, membranous, very early caducous. Receptacle cylindrical, 7-9 mm long, with short dense puberulous pubescence on exterior, glabrous within except for deflexed hairs at throat and dense lanate pubescence around stamen bases; pedicels 2-6 mm long, thin. Calyx lobes 5, acute, with sessile glands around margins. Petals 5, glabrous except for ciliate margins. Stamens c. 17, inserted around a complete circle. Ovary densely lanate. Style pubescent for 3/4 of its length. Fruit ellipsoid pyriform, tapering towards apex, 4.5 cm long × 3 cm broad; exocarp smooth, glabrous; pericarp hard, fibrous, 3 mm thick, glabrous within.

Couepia eriantha Spruce ex Hook.f.

DESCRIPTION

Leaf: shape oblanceolate/oblong; **indumentum** glabrous. **Inflorescence:** type panicle. **Flower:** receptacle shape cylindric; stamen number 25 - 45; **filament fusion** free. **Fruit:** epicarp glabrous/smooth.

ADDITIONAL DESCRIPTION

Shrubs or small trees. Leaves: stipules to 3 mm long, linear, caducous; petioles 3.5-6 mm long, pubescent; lamina oblong to oblong-lanceolate, 10-14 × 3-5.5 cm, cordate to cuneate at base, apiculate or acuminate at apex with acumen to 5 mm long, glabrous on both surfaces; primary veins 15-20 pairs, prominent beneath. Inflorescences terminal and axillary panicles; rachis and branches densely brown-villous. Bracts and bracteoles ovate, to 15 mm long, persistent. Receptacle cylindrical, 15-18 mm long, densely ferrugineous-villous on exterior, glabrous within except for deflexed hairs at throat. Calyx lobes rounded, sericeous. Petals 5, white, pubescent, ciliate on margins. Stamens c. 40, inserted in a complete circle. Ovary densely villous. Style pubescent for 3/4 its length. Fruit (immature) long and narrow, with smooth glabrous epicarp.

Couepia excelsa Ducke

DESCRIPTION

Leaf: shape elliptic/oblong/lanceolate; **indumentum** arachnoid. **Inflorescence:** type panicle/raceme. **Flower:** receptacle shape campanulate; **stamen number** 25 - 45; **filament fusion** free. **Fruit:** epicarp glabrous/smooth.

ADDITIONAL DESCRIPTION

Trees to 25 m tall. Leaves: stipules to 3 mm long, caducous; petioles 8-10.5 mm long, terete, pubescent; lamina elliptic to oblong-lanceolate, 13-25 × 4-7 cm, rounded to subcordate at base, acuminate at apex with acumen 4-9 mm long, sparsely appressed-pubescent above, becoming glabrous with age, densely grey-arachnoid beneath; midrib sparsely pubescent above; primary veins 23-38 pairs, prominent on lower surface. Inflorescences short-branched panicles or racemes, axillary or terminal, 3-6 cm long; rachis and branches brown tomentellous. Bracts and bracteoles ovate, to 8 mm long, caducous. Receptacle subcampanulate, 9 mm long, densely brown-pubescent on exterior; interior lined to base by dense reflexed hairs; pedicels 2-3 mm long. Calyx lobes rounded, ovate, 4.5-6 mm long. Petals 5, white, ciliate on margins. Stamens 38-40, inserted in an arc of 270°, sometimes with a short sterile toothed portion of circle opposite. Ovary villous. Style pubescent almost to apex. Fruit oval, 6-7 × 4 cm; epicarp smooth, glabrous; endocarp granular, fragile, glabrous within.

Couepia froesii Prance

DESCRIPTION

Leaf: shape oblong; **indumentum** lanate-pubescent. **Inflorescence:** type panicle. **Flower:** receptacle shape campanulate; stamen number 25 - 45; **filament fusion** free. **Fruit:** epicarp glabrous/smooth.

ADDITIONAL DESCRIPTION

Trees. Branches glabrous when young, lenticellate. Leaves: stipules small, caducous; petiole 6-8 mm long, glabrous, eglandular, canaliculate above; lamina oblong, 11-23 × 4.5-8.5 cm, caudate-acuminate at apex with acumen 8-14 mm long, rounded at base, glabrous above, densely short-grey-lanate pubescent beneath; midrib glabrous; primary veins 20-24 pairs, impressed above, prominent beneath. Inflorescences little-branched terminal and axillary panicles; rachis and branches densely grey-pubescent. Bracts and bracteoles small, caducous. Receptacle subcampanulate, 6 mm long, grey-pubescent on exterior, glabrous within except around throat below stamens; pedicels c. 1 mm long. Calyx lobes acute. Petals 5, white, caducous; margins shortly ciliate. Stamens c. 30, inserted around complete circle. Ovary pilose. Style pubescent to middle. Fruit when young ovoid; exocarp smooth, pubescent soon becoming glabrous; endocarp granular, thin, fragile.

Couepia glabra Prance

DESCRIPTION

Leaf: shape oblanceolate/oblong; **indumentum** glabrous. **Inflorescence:** type panicle/raceme. **Flower:** receptacle shape cylindric/turbinate; **stamen number** more than 60; **filament fusion** free. **Fruit:** epicarp unknown.

ADDITIONAL DESCRIPTION

Trees to 10 m tall. Branches glabrous when young. Leaves: stipules lanceolate, membranous, c. 2 mm long, caducous; petioles 8-12 mm long, glabrous, canaliculate, rugose, eglandular; lamina oblong to oblong-lanceolate, coriaceous, 11-21 × 4-7 cm; base subcuneate; apex acuminate with acumen 5-9 mm long, usually curved; glabrous on both surfaces; midrib prominent on both surfaces; primary veins 16-17 pairs, prominulous or plane above, prominent beneath. Inflorescences of terminal and axillary panicles, 4.5-9 cm long, or rarely of unbranched racemes; rachis and branches with minute sparse pubescence. Bracts and bracteoles caducous. Receptacle cylindrical-turbinate, 15-20 mm long, sparsely puberulous in bud, soon becoming glabrous, glabrous within except for dense deflexed hairs around throat. Calyx lobes 5, sparsely puberulous when young, soon becoming glabrous; margins ciliate. Petals 5, glabrous, caducous. Stamens c. 110, inserted around a complete circle; filaments tomentose around base, glabrous for most of length. Ovary pilose. Style pilose at base, glabrous above. Fruit unknown.

Couepia grandiflora (Mart. & Zucc.) Benth.

Has as synonym

basionym *Moquilea grandiflora* Mart. & Zucc.

heterotypic *Couepia formosana* Taub.

heterotypic *Couepia suberosa* Pilg.

DESCRIPTION

Leaf: shape ovate/oblong; **indumentum** arachnoid. **Inflorescence:** type panicle. **Flower:** receptacle shape campanulate; **stamen number** 55 - 60/more than 60; **filament fusion** free. **Fruit:** epicarp glabrous/smooth.

ADDITIONAL DESCRIPTION

Trees to 8 m tall. Branches pubescent when young; older branches often with a conspicuous thick cork covering c. 4 mm thick. Leaves: stipules to 2 mm long, subulate, caducous; petioles 3-13 mm long, pubescent, terete; lamina oblong to ovate, 7.5-18 x 3.5-9 cm, cordate to cuneate at base, rounded to bluntly acuminate at apex, glabrous above, or with sparse ferruginous pubescence when young, shortly dense-arachnoid beneath; primary veins 10-16 pairs, prominent beneath, prominulous above; midrib prominent on both surfaces. Inflorescences terminal and axillary panicles; rachis and branches with dense yellow-brown pubescence. Bracts and bracteoles 1.5-5 mm long, ovate, membranous, caducous. Receptacle campanulate, 5-11.5 mm long, densely cinereous-pubescent, glabrous within except for deflexed hairs at throat; pedicels 25 mm long. Calyx lobes rounded. Petals 5, white, pubescent, ciliate on margins, caducous. Stamens 50-125, inserted in a complete circle. Ovary densely villous. Style pubescent for most of its length. Fruit oblong; epicarp smooth, glabrous, drying black; pericarp thick, fleshy, glabrous within.

COMMENTS

DESCRIPTION

Leaf: shape oblong/lanceolate; **indumentum** glabrous/pubescent/lanate. **Inflorescence:** type panicle/raceme. **Flower:** receptacle shape campanulate/cylindric; **stamen number** 14 - 30; **filament fusion** free. **Fruit:** epicarp glabrous/smooth.

ADDITIONAL DESCRIPTION

Trees to 25 m tall. Branches puberulous when young, soon becoming glabrous. Leaves: stipules 1-3 mm long, linear, early caducous; petioles 3-9 mm long, canaliculate above, pubescent when young, becoming glabrous and rugose with age; lamina oblong to oblong-lanceolate, membranous to coriaceous, 4.5-16.5 x 2.5-5.5 cm, rounded to subcuneate at base, acuminate at apex with acumen 5-18 mm long, glabrous above, densely grey- to brown-lanate, or glabrous, or with a sparse caducous pubescence beneath, frequently with 2 glands at junction with petiole; primary veins 10-15 pairs, plane above, prominent beneath; midrib prominulous above, prominent beneath. Inflorescences terminal and axillary little branched panicles or racemes; rachis and branches sparsely puberulous to glabrous. Bracts and bracteoles minute, membranous, ovate, caducous. Receptacle cylindrical to subcampanulate, 4.5-10 (-12) mm long, 1-2.5 mm broad below calyx, sparsely puberulous to glabrous externally, glabrous within except for deflexed hairs around throat; pedicels 0.5-4 mm long. Calyx lobes 5, rounded, 22.5 mm long, puberulous or glabrous externally. Petals 5, white, ciliate. Stamens 14-30, unilateral, inserted around 1/2 of a circle with short staminodes opposite them. Ovary villous. Style pubescent for at least 1/2 its length. Fruit rounded to ovoid, 3-4 cm long, 2.5-3 cm broad; exocarp smooth, glabrous; mesocarp thin, fleshy; endocarp thin, fragile, granular in texture, glabrous within.

Couepia habrantha Standl.

DESCRIPTION

Leaf: shape oblong-elliptic; **indumentum** arachnoid. **Inflorescence:** type racemose. **Flower:** **receptacle shape** subcylindrical; **stamen number** 14 - 30; **filament fusion** free. **Fruit:** **epicarp** glabrous/smooth.

ADDITIONAL DESCRIPTION

Trees to 12 m tall. Leaves: stipules to 2 mm long, caducous; petioles 5-8 mm long, canaliculate above; lamina oblong-elliptic, 6-13 × 2.5-6 cm, cuneate to rounded at base, acuminate at apex with acumen 4-14 mm long, glabrous above, densely reddish-brown to grey-arachnoid beneath; midrib prominent and glabrous on upper surface; primary veins 11-15 pairs, prominent beneath. Inflorescences short dense axillary and terminal spikes; rachis with ferrugineous-brown pubescence. Bracts and bracteoles 7-9 mm long, ovate, acute, deciduous.

Receptacle subsessile, subcylindrical, 8-10 mm long, densely ferrugineous-sericeous on exterior, glabrous within except for deflexed hairs at throat. Calyx lobes rounded. Petals 5, white, ciliate on margins. Stamens c. 25, inserted in a semicircle, with short filamentous staminodes opposite. Style densely pubescent for 3/4 of its length. Ovary pilose. Fruit ellipsoid; epicarp smooth, glabrous; mesocarp thin, fleshy; pericarp thin, fibrous, fragile, glabrous within.

Couepia impressa Prance

This treatment is composed of the following taxa: *Couepia impressa*, *Couepia impressa* subsp. *cabraliae*, *Couepia impressa* subsp. *impressa*.

DESCRIPTION

Leaf: shape ovate/oblong/lanceolate; **indumentum** pubescent. **Inflorescence:** type panicle. **Flower:** receptacle shape campanulate; **stamen number** 14 - 30; **filament fusion** fused basally. **Fruit:** epicarp glabrous/smooth.

ADDITIONAL DESCRIPTION

Trees. Branches glabrous when young. Leaves: stipules c. 2 mm long, subulate, caducous; petiole 6-12 mm long, glabrous, canaliculate, eglandular; lamina oblong to oblong-lanceolate or ovate, 9-22 x 4-8.5 cm, acuminate at apex with acumen 3-7 mm long, rounded at base, glabrous above, sparsely pubescent beneath; midrib glabrous above; primary veins 14-22 pairs, impressed above, prominent beneath. Inflorescences of terminal panicles; rachis and branches densely grey-pubescent. Bracts and bracteoles ovate, 2-3.5 mm long, caducous. Receptacle subcampanulate, 6-7 mm long, slightly curved, grey-puberulous on exterior, glabrous within except for ring of deflexed hairs around throat. Calyx lobes acute. Petals 5, caducous; margins shortly ciliate. Stamens 15-17 inserted around 2/3 of circle; filaments slightly connate at base. Ovary villous. Style pubescent to middle. Fruit globose to ellipsoid; 4.5-6 x 3-3.5 cm; exocarp smooth, glabrous; mesocarp fleshy, 35 mm thick when dry; endocarp c. 1 mm thick, fibrous, glabrous within.

Couepia insignis Fritsch

DESCRIPTION

Leaf: shape oblong; **indumentum** arachnoid. **Inflorescence:** type raceme. **Flower:** receptacle shape cylindric; **stamen number** 55 - 60; **filament fusion** free. **Fruit:** epicarp glabrous/rugose.

ADDITIONAL DESCRIPTION

Trees. Leaves: stipules linear, to 15 mm long, membranous, caducous; petioles 8-11 mm long, sparsely pubescent, terete; lamina oblong, 15-24 × 8-9.5 cm, rounded at apex, rounded to cordate at base, glabrous above, densely grey-arachnoid beneath; primary veins 21-25 pairs, impressed above, prominent beneath, arcuate and anastomosing near the lamina margin. Inflorescences few-flowered racemes; rachis with short rufous pubescence. Bracts and bracteoles persistent, 10-28 mm long, oblong, acuminate, membranous. Receptacle subcylindrical, 8-9 mm long, with short brown pubescence on exterior, glabrous within except for deflexed hairs at throat; pedicels 1-2 mm long. Calyx lobes oblong-lanceolate, 10-12 mm long, acute. Petals 5, ciliate on margins. Stamens numerous (over 50). Ovary villous. Style pubescent for 3/4 its length. Fruit (section only seen) 7.5 cm diam.; exocarp glabrous, wrinkled when dry; mesocarp fleshy, 4-10 mm thick when dry; endocarp c. 1 mm thick, fibrous, glabrous within.

Couepia joaquinae Prance

DESCRIPTION

Leaf: shape oblanceolate/oblong; **indumentum** glabrous. **Inflorescence:** type panicle/raceme. **Flower:** receptacle shape cylindric; **stamen number** less than 14; **filament fusion** free. **Fruit:** epicarp glabrous/verrucose.

ADDITIONAL DESCRIPTION

Trees 20-30 m tall. Branches glabrous when young. Leaves: stipules triangular, membranous, 1.5-2 mm long, early caducous; petioles 7-12 mm long, terete, eglandular, glabrous; lamina oblong to oblong-lanceolate, chartaceous, 10-15 × 3-5.5 cm broad, cuneate at base, acuminate at apex with acumen 8-15 mm long, often slightly curved, glabrous on both surfaces; midrib plane above, prominent and glabrous beneath; primary veins 10-14 pairs, plane above, prominulous beneath. Inflorescence of terminal and axillary panicles or rarely racemes; flowers borne in small groups of 2-4 along rachis; rachis and branches glabrous or sparsely puberulous. Bracts and bracteoles minute, lanceolate, membranous, caducous, sparsely puberulous. Receptacle narrowly cylindrical, almost glabrous and striate when dry on exterior, glabrous within except for few hairs at base. Calyx lobes 5, acute, sparsely puberulous on exterior; margins ciliate. Petals 5, white, glabrous. Stamens 9-11, unilateral; filaments exserted, glabrous. Ovary lanate. Style glabrous except for few hairs at base. Fruit ovoid, 3.5-4.5 × 1.9-2.4 cm; exocarp sparsely and inconspicuously lenticellate; mesocarp 1.5 mm thick, fleshy; endocarp 0.5 mm thick, hard, fibrous, glabrous within.

Couepia krukovii Standl.

DESCRIPTION

Leaf: shape oblanceolate/oblong; **indumentum** glabrous. **Inflorescence:** type raceme. **Flower:** receptacle shape cylindric; **stamen number** more than 60; **filament fusion** free. **Fruit:** **epicarp** unknown.

ADDITIONAL DESCRIPTION

Trees, small to medium-sized. Leaves: stipules linear, to 1.5 cm long, caducous; petioles thick, 3-6 mm long, glabrous, eglandular, terete; lamina oblong-oblanceolate, 22-33 × 6-7.5 cm, rounded to cordate at base, acuminate at apex with acumen 7-10 mm long, glabrous on both surfaces except when very young; midrib prominent above, glabrous when mature; primary veins 17-23 pairs, prominent beneath, slightly impressed above. Inflorescences denselyflowered terminal and axillary spicate racemes; rachis with short tomentellous brown pubescence. Bracts and bracteoles 6-10 mm long, ovate, acute, persistent. Receptacle subsessile, cylindrical, 2.5 cm long, slightly curved, with short dense brown pubescence on exterior, glabrous within except for deflexed hairs at throat. Calyx lobes rounded, 1 cm long. Petals 5, ciliate on margins. Stamens numerous (c. 255), inserted in a complete circle. Ovary villous. Style pubescent for 2/3 its length. Fruit unknown.

Couepia latifolia Standl.

DESCRIPTION

Leaf: shape ovate; **indumentum** glabrous/arachnoid. **Inflorescence:** type raceme. **Flower:** receptacle shape cylindric; **stamen number** more than 60; **filament fusion** free. **Fruit:** epicarp glabrous/smooth.

ADDITIONAL DESCRIPTION

Trees. Leaves: stipules lanceolate, c. 3 mm long, subpersistent; petioles 4-9 mm long, pubescent, with 2 medial glands, terete; lamina oblong-ovate, 17-24 × 5-12 cm, glabrous above, sparsely grey-arachnoid or glabrous beneath, rounded at base, rounded or with short and blunt acumen at apex; primary veins 16-19 pairs, prominent beneath, slightly impressed above. Inflorescences axillary racemes; rachis tomentellous. Bracts and bracteoles 4-8 mm long, ovate, acute, persistent, tomentellous on exterior. Receptacle cylindrical, sessile, 1.5-2.5 cm long, with dense light-brown pubescence on exterior, glabrous within except for deflexed hairs at throat. Calyx lobes rounded. Petals 5, persistent, ciliate on margins. Stamens numerous, inserted in a complete circle. Ovary villous. Style densely pubescent for 3/4 its length. Fruit ovoid, 5-9 cm long, 1.5-5.5 cm broad; epicarp smooth, glabrous; mesocarp thick, fleshy; endocarp thin, of a granular texture, fragile, glabrous within.

Couepia longipetiolata Prance

DESCRIPTION

Leaf: shape oblong; **indumentum** lanate-pubescent. **Inflorescence:** type panicle. **Flower:** receptacle shape campanulate/turbinate; **stamen number** 14 - 30; **filament fusion** free. **Fruit:** epicarp unknown.

ADDITIONAL DESCRIPTION

Trees to 8 m tall. Branches glabrous when young, conspicuously lenticellate. Leaves: stipules small, ovate, membranous, caducous; petioles 14-18 mm long, canaliculate on upper surface, lanate pubescent, transversely rugose, 2-3 mm thick; lamina oblong, coriaceous, 12-15 × 4-4.5 cm, cuneate at base, shortly and abruptly acuminate at apex with acumen 2-3 mm long, glabrous above except on midrib, lanate brown-pubescent beneath, appearing smooth but pubescence covering a deeply reticulate venation with stomatal crypts; midrib prominent beneath, slightly impressed and lanate on basal 1/2 above; primary veins 11-13 pairs, slightly prominent beneath, slightly impressed to plane above. Inflorescences of terminal and subterminal panicles, densely crowded, short branched; rachis and branches rufoustomentellous. Bracts caducous, to 5 mm long, membranous, glabrous; bracteoles caducous, c. 1 mm long, tomentellous on exterior. Receptacle campanulate-turbinate, 4-5 mm long, rufous tomentellous on exterior, glabrous within except for deflexed hairs at throat. Calyx lobes acute, tomentellous on both surfaces. Petals 5, cream, glabrous with ciliate margins. Stamens c. 30, inserted around a complete circle, far exserted. Ovary villous-pubescent. Style pilose-tomentose almost to apex, slightly exceeding the filaments. Fruit not seen.

Couepia macrophylla Spruce ex Hook.f.

Has as synonym

heterotypic *Couepia speciosa* Pilg.

DESCRIPTION

Leaf: shape oblong; **indumentum** arachnoid. **Inflorescence:** type raceme. **Flower:** receptacle shape cylindric; **stamen number** more than 60; **filament fusion** free. **Fruit:** epicarp glabrous/smooth.

ADDITIONAL DESCRIPTION

Trees, small. Leaves: stipules 15-20 mm long, linear, caducous; petioles thick, 8-15 mm long, terete, sparsely pubescent, with 2 medial sessile glands; lamina oblong to oblong-elliptic, 19-22 x 6-12 cm on flowering branches (much larger on sterile branches, up to 40 x 14 cm), glabrous above, densely rufous-to-grey arachnoid beneath, rounded to cordate at base, abruptly obtuse to abruptly acuminate at apex with acumen 4-8 mm long; primary veins 26-30 pairs, prominent beneath, slightly impressed above. Inflorescences dense-flowered racemes; rachis with short reddish-brown pubescence. Bracts and bracteoles ovate, to 15 mm long, persistent. Receptacle 20-25 mm long, cylindrical, with short reddish-brown pubescence on exterior, glabrous within except for deflexed hairs at throat; pedicels 2-3.2 mm long. Calyx lobes rounded. Petals 5, persistent, sparsely ciliate at margins. Stamens numerous (c. 280), inserted in a complete circle, in many rows. Ovary villous. Style densely pubescent throughout. Fruit (when young) ellipsoid, 4 x 1.5 cm; exocarp smooth, glabrous.

Couepia monteclarensis Prance

DESCRIPTION

Leaf: shape oblong; **indumentum** pubescent/lanate. **Inflorescence:** type panicle. **Flower:** receptacle shape cylindric; **stamen number** 14 - 30; **filament fusion** free. **Fruit:** epicarp glabrous/smooth.

ADDITIONAL DESCRIPTION

Trees. Branches glabrous when young, conspicuously lenticellate. Leaves: stipules caducous (not seen); petioles 8-10 mm long, glabrescent, canaliculate, with a single gland on 1 side or eglanular; lamina oblong, chartaceous, 7.5-11 × 3.3-4.6 cm, subcuneate at base, apiculate at apex with apex 4-6 mm long, glabrous above, with a short brown-lanate pubescence beneath; midrib prominulous above, prominent beneath; primary veins 8-10 pairs, plane above, prominent beneath. Inflorescences of terminal panicles, 6-8 cm long, with a central rachis and short dichotomous branches bearing 2 to 4 flowers; rachis and branches grey-puberulous. Receptacle cylindrical, 5-7 mm long, grey puberulous externally, glabrous within except for deflexed hairs at throat; pedicels 3-5 mm long, articulated at middle and with lower part persistent after flower dehiscence. Calyx lobes 5, rounded to slightly acute, 2-3 mm long, grey puberulous on exterior. Petals 5, white, glabrous except for ciliate margins. Stamens 18-20, inserted almost around complete circle. Ovary inserted near mouth of tube, lanate. Style hirsute for 3/4 of length. Fruit when young ovoid; exocarp smooth, glabrous; mesocarp granular; endocarp bony, glabrous within.

Couepia morii Prance

DESCRIPTION

Leaf: shape oblong; **indumentum** lanate-pubescent. **Inflorescence:** type panicle. **Flower:** receptacle shape cylindric; **stamen number** 14 - 30; **filament fusion** free. **Fruit:** epicarp unknown.

ADDITIONAL DESCRIPTION

Trees to 30 m tall. Branches sparsely puberulous when young soon becoming glabrous. Leaves: stipules caducous (not seen); petioles 6-10 mm long, sparsely puberulous soon becoming glabrous, eglanular, rugose, canaliculate above; lamina oblong, coriaceous, 7-13.5 × 3-5.8 cm; base rounded to subcuneate; apex abruptly acuminate with acumen 5-12 mm long; glabrous above, densely appressed lanate pubescent beneath; midrib glabrous and prominent above, prominent beneath; primary veins 16-19 pairs, plane above, prominent beneath. Inflorescences of terminal and axillary little-branched panicles, 2-5 cm long; rachis and branches tomentellous; flowers borne on rachis or on small branches in groups of 2 or 3. Bracts and bracteoles large and enclosing groups of buds but very early caducous and only visible in young inflorescences, 3-15 mm long, membranous tomentellous on exterior, puberulous within. Receptacle cylindrical, tomentellous on exterior, glabrous within except at throat. Calyx lobes 5, tomentellous on exterior. Petals 5, glabrous except for ciliate margins. Stamens c. 20, inserted around complete circle, with a mass of deflexed hairs around base. Ovary tomentellous, inserted at mouth of receptacle. Style hirsute for 1/2 of length. Fruit not seen.

Couepia multiflora Benth.

Has as synonym

basionym *Moquilea multiflora* (Benth.) Walp.

DESCRIPTION

Leaf: shape oblong-elliptic/oblong; **indumentum** arachnoid. **Inflorescence:** type panicle. **Flower:** receptacle shape cylindric; stamen number 25 - 45; **filament fusion** free. **Fruit:** epicarp glabrous/smooth.

ADDITIONAL DESCRIPTION

Trees to 6 m tall. Leaves: stipules linear, to 9 mm long, caducous, membranous; petioles 4-7 mm long, pubescent, terete, eglandular; lamina oblong to oblong-elliptic, 9-15 × 4-9 cm, rounded to cordate at base, rounded to short-acuminate at apex with acumen 1-5 mm long, glabrous above, densely grey-arachnoid beneath; midrib prominent beneath, pubescent above; primary veins 12-14 pairs, prominent beneath, slightly impressed above. Inflorescences terminal panicles; rachis and branches densely brown-tomentose. Bracts and bracteoles 2-5 mm long, oblong to lanceolate, caducous. Receptacle c. 7 mm long, cylindrical, curved anteriorly in bud, with short thick brown tomentum on exterior, glabrous within except for deflexed hairs at throat; pedicels 1 mm long. Calyx lobes rounded. Petals 5, white; margins glabrous or with a few isolated hairs. Stamens c. 28, inserted in an arc of c. 240°, with a sterile portion of circle opposite. Ovary pilose. Style pubescent for 1/2 its length. Fruit ellipsoid, 6.5 × 3.5 cm; exocarp smooth, glabrous; mesocarp c. 3 mm thick when dry, fleshy; endocarp thin, fibrous.

Couepia obovata Ducke

DESCRIPTION

Leaf: shape obovate; **indumentum** indumentum. **Inflorescence:** type raceme. **Flower:** receptacle shape cylindric; **stamen number** 14 - 30; **filament fusion** free. **Fruit:** epicarp glabrous/smooth.

ADDITIONAL DESCRIPTION

Trees, small to medium-sized. Leaves: stipules 1-2 mm long, lanceolate, caducous; petioles 3-7 mm long; lamina obovate, 4-10 × 2-5 cm, subcuneate at base, bluntly acuminate at apex with acumen 2-5 mm long, glabrous above, with a sparse covering of appressed grey hairs beneath; primary veins 8-10 pairs, prominent beneath. Inflorescences terminal and axillary racemes, 3-6 cm long; rachis with sparse silver-grey pubescence. Bracts and bracteoles 1.5-3.5 mm long, ovate, persistent. Receptacle cylindrical, 7-9 mm long curved, with a few short appressed hairs on exterior, glabrous within except for deflexed hairs at throat, subsessile. Calyx lobes rounded. Petals 5, white, ciliate on margins. Stamens 16-21, inserted in a complete circle. Ovary lanate. Style glabrous except at base. Fruit ovoid, 2-3 × 1.5-2.5 cm; epicarp smooth, glabrous; endocarp thick, hard, of a granular texture, glabrous within.

heterotypic *Moquilea hypoleuca* (Miq.) B.D.Jacks.

DESCRIPTION

Leaf: shape ovate; **indumentum** arachnoid. **Inflorescence:** type panicle. **Flower:** receptacle shape campanulate; **stamen number** 14 - 30; **filament fusion** free. **Fruit:** epicarp glabrous/smooth.

ADDITIONAL DESCRIPTION

Shrubs, dwarf to medium-sized trees. Leaves: stipules to 2 mm long, caducous; petioles 4-7 (-10) mm long, pubescent when young, shallowly canaliculate; lamina ovate, 4-10.5 x 2.5-7 cm, rounded to cordate at base, short-acuminate at apex with acumen 1-7 mm long, glabrous above, densely silver-grey-arachnoid beneath, sometimes becoming glabrous with age; midrib prominent beneath, pubescent above when young; primary veins 11-15 pairs, prominent beneath, impressed above. Inflorescences terminal panicles; rachis and branches with short light brown pubescence. Bracts and bracteoles oblong-ovate, 3-6.5 mm long, caducous. Receptacle subcampanulate, 4-5 mm long, densely light-brown-pubescent on exterior, glabrous within except for deflexed hairs at throat; pedicels 1.5-4 mm long. Calyx lobes rounded, 3-4 mm long. Petals 5, white, ciliate on margins. Stamens 16-19, inserted in an arc of 240 degrees, with a sterile portion opposite. Ovary densely pilose. Style pubescent for 1/2 its length. Fruit elliptic; epicarp smooth, glabrous or softly pubescent when young; mesocarp thin, fleshy; endocarp thin, fragile, granular, glabrous within.

Couepia oxossii Amorim & Asprino

DESCRIPTION

Leaf: shape elliptic/ovate/oblong; **indumentum** arachnoid. **Inflorescence:** type panicle. **Flower:** receptacle shape cylindric; **stamen number** 14 - 30; **filament fusion** free. **Fruit:** epicarp glabrous/smooth/rugose.

ADDITIONAL DESCRIPTION

Trees to 15 m tall. Leaves: stipules 2.2–3 mm long, early caducous, eglandular; petiole 3–5 mm long, sparsely velutinous-arachnoid to glabrescent, eglandular; lamina 2.2–3.6(–6) x 1.4–2.7(–3.5) cm, coriaceous, oblong to ovate, rarely widely elliptic, base obtuse to rounded or subcordate, apex obtuse to rounded, margins revolute 5–10(–11) pairs of secondary veins; lamina dense velutinous-arachnoid, midvein prominent, secondary veins plane, tertiary veins and reticulation not visible. Inflorescence a terminal or subterminal panicle, erect, rachis velutinous-arachnoid; bracts and bracteoles 1–1.2 mm long, triangular, caducous; pedicel 2–3 mm long. Flowers 9–11 mm long; receptacle cylindrical, often slightly curved, outside sparsely velutinous-arachnoid, inside glabrous except for dehisced hairs near throat; calyx lobes widely ovate, 3–3.5 x 2–3 mm, margin eglandular or sometimes bearing tiny sessile glands; petals 5, oblong, glabrous, whitish, caducous; stamens 15–18, inserted in a complete circle or semi-circle, filaments 6–12 mm long, glabrous; ovary lanate; style 10–11 mm long, liform, hirsute up to 3/4 of length, stigma truncate. Drupe 3.3–3.5 x 2.0–2.2 cm, fleshy, ellipsoid, tapering towards apex, green when immature; epicarp smooth to slightly rugose, glabrous; pericarp 1.0–2.0 mm thick, hard, granular, glabrous within; seeds ca. 2.7 x 1.4 cm.

Couepia paraensis (Mart. & Zucc.) Benth.

This treatment is composed of the following taxa: *Couepia paraensis*, *Couepia paraensis* subsp. *cerradoana*, *Couepia paraensis* subsp. *glaucescens*, *Couepia paraensis* subsp. *paraensis*.

Has as synonym

basionym *Moquilea paraensis* Mart. & Zucc.

DESCRIPTION

Leaf: shape ovate/oblong; **indumentum** glabrous/puberulous/arachnoid. **Inflorescence:** type panicle. **Flower:** receptacle shape campanulate/subcylindrical; **stamen number** 25 - 45; **filament fusion** free. **Fruit:** epicarp smooth.

ADDITIONAL DESCRIPTION

Trees to 20 m tall, usually smaller. Leaves: stipules 1-2 mm long, caducous; petioles 4-7 mm long, pubescent, canaliculate above; lamina ovate to oblong, 5.5-16 x 2.5-8.5 cm, rounded to cordate at base, blunt or short-acuminate at apex, with acumen 15 mm long, glabrous above, usually densely grey to brown lanate-arachnoid beneath, rarely glabrous or puberulous, with 2 glands at base of lower surface of lamina; primary veins 10-15 pairs, prominent beneath; midrib glabrous or pubescent above. Inflorescences terminal panicles, sparsely appressed pubescent. Bracts and bracteoles 0.5-2.5 mm long, ovate, caducous. Receptacle subcylindrical to subcampanulate, 8-12 mm long, sparsely appressed-pubescent on exterior, completely hairy within or glabrous except for deflexed hairs at throat. Calyx lobes rounded. Petals 5, white, ciliate on margins. Stamens 25-45, inserted in 1/2 to 2/3 of a circle, with short staminodes opposite. Ovary pilose. Style densely pubescent for 3/4 of its length. Fruit ellipsoid, 3.5-4 cm long x 2-3 cm broad; epicarp smooth, glabrous; mesocarp thin, fleshy; endocarp thin, fragile, granular in texture, with interior glabrous.

Couepia parvifolia Prance

DESCRIPTION

Leaf: shape oblanceolate/oblong; **indumentum** tomentose/lanate. **Inflorescence:** type panicle. **Flower:** receptacle shape campanulate; **stamen number** 25 - 45; **filament fusion** free. **Fruit:** epicarp glabrous/smooth.

ADDITIONAL DESCRIPTION

Trees. Branches tomentellous when young, soon becoming glabrous. Leaves: stipules to 2 mm long, caducous; petioles 5-7 mm long, lanate-pubescent, glabrescent, eglandular, canaliculate above; lamina oblong to oblong lanceolate, $2.5\text{-}6.5 \times 0.8\text{-}2.5$ cm, acuminate at apex with acumen 5-7 mm long, cuneate at base, glabrous above, densely lanate-tomentose beneath; midrib glabrous; primary veins 7-9 pairs, prominent beneath. Inflorescences little-branched terminal panicles; rachis and branches brown-tomentose. Bracts and bracteoles 1-2.5 mm long, ovate, caducous. Receptacle subcampanulate, 5-6 mm long, brown-tomentose on exterior, glabrous within except for around throat beneath stamens; pedicels short, 0.25 mm long. Calyx lobes rounded. Petals 5, densely pubescent; margins ciliate. Stamens c. 28, inserted around complete circle. Ovary densely lanate pubescent. Fruit ovoid, 3.5×2.2 cm; exocarp smooth, glabrous; endocarp thin, granular on exterior, fragile, glabrous within.

Couepia pernambucensis Prance

DESCRIPTION

Leaf: shape elliptic/ovate/oblong; **indumentum** pubescent/arachnoid. **Inflorescence:** type panicle. **Flower:** receptacle shape cylindric; **stamen number** 14 - 30; **filament fusion** free. **Fruit:** epicarp glabrous/smooth.

ADDITIONAL DESCRIPTION

Trees. Branches puberulous when young, soon becoming glabrous and lenticellate. Leaves: stipules small, caducous; petioles 4-5 mm long, lanate-pubescent, eglandular, canaliculate above; lamina ovate-elliptic to oblong, 5-6.5 × 2-2.8 cm, acuminate at apex with acumen 2-6 mm long, rounded at base, glabrous above, sparsely arachnoid pubescent beneath; midrib pubescent towards base; primary veins 8-10 pairs, prominent beneath. Inflorescences of terminal and axillary panicles; rachis and branches densely tomentellous. Bracts and bracteoles to 2.5 mm long, caducous. Receptacle cylindrical, 5-6 mm long, slightly curved, densely tomentellous on exterior, glabrous within except for ring of hairs around throat; pedicels c. 1 mm long. Calyx lobes acute. Petals 5, caducous, white; margins ciliate. Stamens 14-17, inserted around complete circle. Ovary pilose. Style pilose. Fruit ellipsoid, exocarp smooth, glabrous; endocarp thin, granular, fragile, glabrous within.

Couepia rankiniae Prance

DESCRIPTION

Leaf: shape oblong-elliptic/oblong; **indumentum** lanate. **Inflorescence:** type paniculate. **Flower:** receptacle shape campanulate; **stamen number** more than 60; **filament fusion** free. **Fruit:** epicarp glabrous/verrucose.

ADDITIONAL DESCRIPTION

Trees to 20 m tall. Branches puberulous when young, soon becoming glabrous. Leaves: stipules axillary, lanceolate, c. 3 mm long, membranous, caducous; petioles 7-12 mm long, slightly canaliculate above, usually with 1 or 2 glands on lower surface and glands sometimes extending to midrib, sparsely puberulous, rugose; lamina oblong to oblongelliptic, chartaceous, 7.5-18.5 × 3.5-5.0 cm, rounded at base, abruptly acuminate at apex with acumen 3-10 mm long, glabrous above, with a dense appressed lanate pubescence beneath; midrib prominent and sparsely puberulous, glabrescent beneath, prominulous and glabrous above; primary veins 12-16 pairs, prominent beneath, plane or slightly impressed above. Inflorescence (only 1 partial inflorescence seen) paniculate, with flowers borne in small groups on a single rachis 6-8 cm long; rachis and branches tomentellous. Bracts and bracteoles caducous. Flower bud 12 mm long. Receptacle campanulate, tomentellous on exterior, glabrous within except for pilose mass around throat. Calyx lobes 5, acute, tomentellous on exterior. Petals 5. Stamens numerous, inserted around complete circle. Ovary inserted at mouth of receptacle. Style hirsute at base. Fruit when young globose, glabrous, densely lenticellate on exterior.

Couepia reflexa Ducke

DESCRIPTION

Leaf: shape oblong-elliptic; **indumentum** glabrous. **Inflorescence:** type paniculate/racemose. **Flower:** receptacle shape cylindric; **stamen number** 25 - 45; **filament fusion** free. **Fruit:** epicarp unknown.

ADDITIONAL DESCRIPTION

Trees, medium-sized. Leaves: stipules c. 2 mm long, caducous; petioles 5-8 mm long, glabrous, terete; lamina membranous, oblong-elliptic, 10-17 × 4-8 cm, subcuneate at base, acuminate at apex with acumen 9-10 mm long, glabrous on both surfaces; primary veins 10-13 pairs, prominent on both surfaces. Inflorescences axillary reflexed racemose panicles to 8 cm long; rachis and branches sparsely silver-grey pubescent. Bracts and bracteoles 1-3 mm long, lanceolate, persistent. Receptacle cylindrical, c. 7 mm long, sparsely silver-greypubescent on exterior, glabrous within except for deflexed hairs at throat; pedicels 3 mm long. Calyx lobes oblong, rounded. Petals 5, white, ciliate on margins. Stamens c. 35, inserted in a complete circle. Ovary pilose. Style glabrous except at base. Fruit unknown.

Couepia robusta Huber

DESCRIPTION

Leaf: shape elliptic/oblong; **indumentum** arachnoid. **Inflorescence:** type panicle. **Flower:** receptacle shape campanulate; **stamen number** 25 - 45; **filament fusion** free. **Fruit:** epicarp glabrous/smooth.

ADDITIONAL DESCRIPTION

Trees to 30 m tall. Leaves: stipules to 5 mm long, lanceolate, caducous; petioles 5-8 mm long, with short brown pubescence; lamina oblong to elliptic, 9-23 × 4-11 cm, rounded to cordate at base, rounded or shortly acuminate at apex with acumen 1-5 mm long, glabrous above, densely rufous-brown-arachnoid beneath; primary veins 15-21 pairs, prominent beneath. Inflorescences terminal little-branched panicles; rachis and branches with reddishbrown tomentum. Bracts and bracteoles 3-7 mm long, ovate, caducous. Receptacle subcampanulate, 7-9 mm long, densely reddish-brown-pubescent on exterior, glabrous within except for deflexed hairs at throat; pedicels 2 mm long. Calyx lobes rounded, 6-7 mm long, densely reddish-brown-pubescent on exterior, densely light-brown-pubescent within. Petals 5, white, ciliate on margins. Stamens c. 43, inserted in an arc of c. 240°, with a toothed ridge of staminodes opposite. Ovary densely villous, often with 2 carpels developing. Style pubescent for 1/2 its length. Fruit ovoid, 5-6 × 3.5-4 cm; epicarp smooth, glabrous; mesocarp thick, fleshy, fibrous; endocarp thin, fragile, granular, sparsely pubescent within.

DESCRIPTION

Leaf: shape elliptic; **indumentum** arachnoid. **Inflorescence:** type panicle. **Flower:** receptacle shape turbinate; **stamen number** 55 - 60; **filament fusion** free. **Fruit:** epicarp verrucose.

ADDITIONAL DESCRIPTION

Trees. Leaves: stipules linear, to 17 mm long, caducous; petioles 5-10 mm long, thick; lamina elliptic, 10-27 x 6.5-11.5 cm, subcordate at base, rounded to shortly acuminate at apex, glabrous above, densely rufous-arachnoid beneath; margins undulate, revolute; primary veins 15-25 pairs, prominent beneath, impressed above. Inflorescences terminal many-flowered panicles to 15 cm long; rachis and branches striate, thick, shortly grey-brown-pubescent. Bracts and bracteoles oblong to oblong-lanceolate, to 7 cm long, caducous. Receptacle turbinate, thick-walled, c. 12 mm long, shortly light-brown-pubescent on exterior, glabrous within except for deflexed hairs at throat; pedicels 1-3.5 mm long. Calyx lobes rounded, 5-7 mm long. Petals 5, white, with ciliate margins. Stamens c. 60, inserted in a complete circle. Ovary pilose. Style pubescent for 3/4 of its length. Fruit ovoid, to 11 x 6 cm; epicarp verrucose; mesocarp thin, fleshy; endocarp thick, fragile.

DESCRIPTION

Leaf: shape oblong; **indumentum** arachnoid. **Inflorescence:** type panicle. **Flower:** receptacle shape campanulate; **stamen number** 14 - 30; **filament fusion** free. **Fruit:** epicarp glabrous/smooth.

ADDITIONAL DESCRIPTION

Trees to 25 m tall. Leaves: stipules c. 2 mm long, caducous; petioles 12-15 mm long, sparsely pubescent, shallowly canaliculate; lamina oblong, 10-18 x 4-7 cm, subcordate at base, rounded to short-acuminate at apex with acumen 1-3 mm long, glabrous above, densely grey-brown-arachnoid beneath; primary veins 16-20 pairs, prominent beneath, impressed above. Inflorescences terminal panicles; rachis and branches with short light brown pubescence. Bracts and bracteoles ovate, acute, to 4 mm long, caducous. Receptacle subcampanulate, 5-6 mm long, with short light brown pubescence on exterior, glabrous within except for deflexed hairs at throat; pedicels 2 mm long. Calyx lobes rounded. Petals 5, ciliate on margins. Stamens 15-16, inserted in a semicircle, with a few small filamentous staminodes opposite. Ovary densely villous. Style pubescent for 1/2 its length. Fruit spherical, c. 3.5 cm in diam.; epicarp smooth, glabrous; mesocarp thin, fleshy; endocarp thin, granular, fragile, glabrous within.

Couepia spicata Ducke

DESCRIPTION

Leaf: shape oblong/lanceolate; **indumentum** arachnoid. **Inflorescence:** type racemose. **Flower:** receptacle shape turbinate; **stamen number** 14 - 30; **filament fusion** free. **Fruit:** epicarp unknown.

ADDITIONAL DESCRIPTION

Trees, medium-sized. Leaves: stipules to 4 mm long, lanceolate, caducous; petioles 3-6 mm long, pubescent, shallowly canaliculate; lamina oblong-lanceolate, 4.6-9 × 1.4-2.8 cm, cuneate at base, acuminate at apex with acumen 6-11 mm long, glabrous above, densely reddishbrown-arachnoid beneath; midrib prominent above with lower portion pubescent; primary veins 9-12 pairs, prominent on lower surface. Inflorescences dense-flowered terminal and axillary spikes; rachis with ferruginous-brown sericeous pubescence. Bracts and bracteoles ovate, 3-4 mm long, equalling the flowers, persistent. Receptacle sessile, turbinate, 3-4 mm long, ferruginous-brown pubescent on exterior, glabrous within except for deflexed hairs at throat. Calyx lobes rounded. Petals 5, white, ciliate on margins. Stamens 14-18, inserted in a semicircle, with a sterile portion opposite. Ovary pilose. Style glabrous except at base. Fruit unknown.

Couepia stipularis Ducke

DESCRIPTION

Leaf: shape oblanceolate/oblong; **indumentum** puberulous. **Inflorescence:** type panicle. **Flower:** receptacle shape subcylindrical; **stamen number** 25 - 45; **filament fusion** free. **Fruit:** epicarp unknown.

ADDITIONAL DESCRIPTION

Trees to 30 m tall. Leaves: stipules lanceolate, to 15 mm long, persistent and adnate to base of petiole, silvery-grey-pubescent; petioles 9-15 mm long, silvery-grey-pubescent, terete, with 2 glands near lamina base; lamina oblong to oblong-lanceolate, 10-18 × 3.7-7 cm, rounded to subcordate at base, mucronate at apex with acumen 3-4 mm long, glabrous above, with a few short grey hairs beneath; primary veins 14-20 pairs, prominent beneath. Inflorescences terminal and axillary panicles 4.5-9 cm long, densely-flowered, with a thick erect striated rachis; rachis and branches with sparse appressed grey pubescence. Bracts and bracteoles 1-5 mm long, lanceolate, caducous. Receptacle c. 7 mm long, subcylindrical and curved anteriorly, grey-pubescent on exterior, glabrous within except for deflexed hairs at throat; pedicel 3 mm long. Calyx lobes rounded. Petals 5, white, caducous, glabrous or with a few isolated hairs on margins. Stamens 27-35, inserted in a nearly complete circle. Ovary pilose. Style glabrous except for base. Fruit ovoid, 3.5-5 × 2.5-3.5 cm; pericarp thin, fragile, composed of coarse fibres, glabrous within.

Couepia subcordata Benth. ex Hook.f.

Has as synonym

heterotypic *Couepia amazonica* Fritsch

DESCRIPTION

Leaf: shape oblong-elliptic; **indumentum** arachnoid. **Inflorescence:** type panicle. **Flower:** **receptacle shape** subcylindrical; **stamen number** 25 - 45; **filament fusion** free. **Fruit:** **epicarp** glabrous/smooth.

ADDITIONAL DESCRIPTION

Trees, medium-sized. Leaves: stipules c. 2 mm long, deciduous; petioles 67 mm long, pubescent, terete, eglandular; lamina oblong-elliptic, 12-17 x 5.5-7.5 cm, membranous, cordate to rounded at base, acuminate at apex with acumen 3-8 mm long, glabrous above, with short, thick, silver-grey to brown-arachnoid pubescence beneath; primary veins 13-17 pairs, prominent beneath. Inflorescences terminal and axillary panicles; rachis and branches with short dense light brown pubescence. Bracts and bracteoles ovate, 6-11 mm long, often as long as the receptacle tube, persistent up to early flowering. Receptacle subcylindrical, 9-12 mm long, with short dense pubescence on exterior, glabrous within except for deflexed hairs at throat; pedicels 1-2 mm long. Calyx lobes acute. Petals 5, white, ciliate on margins. Stamens c. 35, inserted in a complete circle. Ovary villous. Style pubescent for 2/3 its length. Fruit ellipsoid, 4.5-9 x 3-5 cm; epicarp smooth, glabrous; mesocarp thick, fleshy; endocarp thin, fragile, fibrous, glabrous within.

Couepia trapezioana Cuatrec.

DESCRIPTION

Leaf: shape ovate/oblong-elliptic; **indumentum** arachnoid. **Inflorescence:** type panicle. **Flower:** receptacle shape cylindric; **stamen number** 14 - 30; **filament fusion** fused basally. **Fruit:** epicarp glabrous/smooth.

ADDITIONAL DESCRIPTION

Trees, medium-sized to large. Leaves: stipules to 2 mm long, linear, caducous; petioles 5-10 mm long, sparsely pubescent, shallowly canaliculate; lamina ovate to oblong-elliptic, 10-15 × 4-10 cm, rounded at base, acuminate at apex with acumen 3-5 mm long, glabrous above, dense grey or brown-appressed-arachnoid beneath; primary veins 14-18 pairs, prominent beneath. Inflorescences terminal panicles; rachis and branches with short light brown pubescence. Bracts and bracteoles oblong-ovate, acute, 6-8 mm long, caducous to subpersistent. Receptacle cylindrical, 7-8 mm long, densely light-brown-pubescent on exterior, glabrous within except for deflexed hairs at throat; pedicels 1 mm long. Calyx lobes narrow, rounded to acute. Petals 5; margins ciliate. Stamens c. 24, inserted in a nearly complete circle; filaments connate at base. Ovary villous. Style pubescent for 1/2 its length. Fruit (immature) ellipsoid; epicarp smooth, glabrous; mesocarp thin, fleshy; endocarp thin, fragile, granular, glabrous within.

Couepia williamsii J.F.Macbr.

DESCRIPTION

Leaf: shape oblanceolate/oblong; **indumentum** lanate. **Inflorescence:** type raceme. **Flower:** receptacle shape cylindric; **stamen number** more than 60; **filament fusion** free. **Fruit:** epicarp glabrous/verrucose.

ADDITIONAL DESCRIPTION

Trees, small. Leaves: stipules to 3 mm long, linear, caducous; petioles 5-7 mm long, with a few stiff erect hairs, shallowly canaliculate above, with 2 inconspicuous glands at lamina base; lamina oblong to oblong-lanceolate, 9-17 × 2.5-5 cm, cuneate to subcuneate at base, abruptly acuminate at apex with acumen 12-22 mm long, glabrous above, densely appressed lanate beneath; primary veins 12-15 pairs, prominent beneath; midrib prominent above.

Inflorescences terminal and axillary few-flowered racemes; rachis sparsely puberulous.

Bracts and bracteoles to 3 mm long, early caducous. Receptacle slender, tubular, 14-19 mm long, curved, glabrous on exterior or with a few appressed hairs, glabrous within except for deflexed hairs at throat; pedicels 3-5 mm long. Calyx lobes rounded. Petals 5, white, ciliate on margins. Stamens c. 70, inserted in a complete circle. Ovary villous. Style pubescent for 2/3 its length. Fruit globose, c. 6.5 cm in diameter; epicarp glabrous, verrucose; mesocarp thick, fleshy; endocarp thin, fragile, granular, glabrous within.

Exelloidendron Prance

This treatment is composed of the following taxa: *Exelloidendron*, *Exelloidendron barbatum*, *Exelloidendron cordatum*, *Exelloidendron coriaceum*, *Exelloidendron gardneri*, *Exelloidendron gracile*.

HOW TO CITE

Sothers, C.A., Prance, G.T. 2020. Exelloidendron in **Flora do Brasil 2020**. Jardim Botânico do Rio de Janeiro. Available at: <http://floradobrasil.jbrj.gov.br/reflora/floradobrasil/FB16784>.

DESCRIPTION

Trees or shrubs. Leaves with a pair of small glands or ill-defined glandular areas on upper surface at junction of lamina and the eglandular petiole; stipules small, lateral, narrowly deltate, caducous; lower surface of lamina glabrous or with a dense arachnoid indumentum which is easily rubbed off. Inflorescence a simple or branched raceme of small congested cymes. Bracts and bracteoles eglandular, small, not enclosing the young flowers in small groups. Flowers bisexual, slightly zygomorphic. Receptacle-tube subcampanulate, slightly swollen on 1 side, hollow, hairy inside throughout. Sepals 5, deltate, acute. Petals 5, as long as sepals, subpersistent. Stamens c. 7; filaments more or less equalling sepals, slightly expanded at base; staminodes c. 7, minute, forming a denticulate rim to the faecal annulus. Ovary monocarpellary, 2-locular, inserted at mouth of receptacle-tube. Drupe fleshy; epicarp smooth; endocarp smooth, with a bony ridge on 1 side at base, without basal obturators, sparsely to densely hairy inside.

COMMENTS

Genus with five species endemic to tropical South America, occurring in Venezuela, the Guianas and Brazil. All five species occur in Brazil. *Exelloidendron* is distinguished by the glabrous or arachnoid pubescent leaves, the unilaterally arranged, exserted stamens, the bilocular ovary represented by five species and is distinguished

DESCRIPTION

Leaf: abaxial indumentum glabrous; **shape** oblong; **petiole length** 4 to 5 mm. **Fruit:** epicarp glabrous/smooth; **shape** oblong.

ADDITIONAL DESCRIPTION

Tree to 20 m tall. Leaves: stipules to 1.5 mm long, caducous; petioles 4-5 mm long, canaliculate above, usually covered by silvery grey hairs; lamina oblong, 8-11 × 2.5-3.5 cm, cuneate at base, acumen 1-2.5 cm long, glabrous on both surfaces; midrib prominent on both surfaces; primary veins 10-15 pairs, not prominent. Inflorescences lax terminal or axillary panicles, with short grey pubescence. Bracts and bracteoles 1-3 mm long, membranous. Receptacle sub-campanulate, swollen slightly to one side, silvery grey-tomentose on interior and exterior. Calyx lobes sharply pointed. Petals 5, white, caducous. Stamens 7, with 7 or 8 filamentous staminodes opposite. Ovary and base of style villous. Fruit oblong, 2-2.5 cm x, 1-1.5 cm; epicarp smooth, glabrous; mesocarp thin, fleshy; endocarp thin, hard, surface smooth, sparsely hirsutulous within.

DESCRIPTION

Leaf: abaxial indumentum glabrous/lanate; **shape** oblong/lanceolate; **petiole length** 2 to 6 mm. **Fruit:** epicarp glabrous/smooth; **shape** ellipsoid.

ADDITIONAL DESCRIPTION

Tree, medium sized. Branchlets grey-arachnoid. Leaves: stipules linear, 2-6 mm long, caducous; petioles 3-5 mm long, canaliculate above, tomentose; lamina $3-6 \times 1.3-2.2$ cm, oblong-lanceolate, glabrous above, with a sparse easily rubbed off lanate indumentum beneath, cuneate at base, narrowed to an acute apex, sometimes acuminate; midrib slightly prominent on both surfaces; primary veins 6-8 pairs, not prominent. Inflorescences terminal panicles 2 cm long; rachis and branches shortly pilose. Bracts and bracteoles 1-1.5 mm long, caducous. Receptacle grey-tomentellous on exterior. Fruit ellipsoid, 3 cm long, 1.2 cm broad, basally narrowed to a stipe 5-6 mm long; epicarp smooth and glabrous; mesocarp thin and fibrous; endocarp hard and thin, with a smooth surface, with interior filled by a lanate mass of long brown hairs.

Gaulettia Sothers & Prance

This treatment is composed of the following taxa: *Gaulettia*, *Gaulettia amaraliae*, *Gaulettia canomensis*, *Gaulettia cognata*, *Gaulettia elata*, *Gaulettia parillo*, *Gaulettia racemosa*.

HOW TO CITE

Sothers, C.A., Prance, G.T. 2020. *Gaulettia* in **Flora do Brasil 2020**. Jardim Botânico do Rio de Janeiro. Available at: <http://floradobrasil.jbrj.gov.br/reflora/floradobrasil/FB604712>.

DESCRIPTION

Trees or shrubs; leaf venation reticulate on the abaxial surface and with hair-filled stomatal cavities, leaves often with a whitish bloom on abaxial surface; prominent parallel secondaries at 90° to primaries; often with a pair of glands at base of leaf; inflorescence and axis densely ferrugineous (except for *G. elata*); inflorescence panicles or racemes; calyx lobes acuminate (rounded to acute in *G. racemosa* and rounded in some *G. cognata*); receptacle 3–10(–22) mm long, receptacle interior glabrous except for the deflexed hairs at the throat; petals 5, white; stamens 12–65, in a complete circle, semi-circle or unilaterally placed around the disk; style mostly glabrous, pubescent at base only; ovary villous to densely villous, unilocular, inserted at mouth of receptacle; fruit hard, epicarp pubescent or verrucose.

COMMENTS

Genus of nine species, occurring throughout northern South America, restricted to Amazonia. In Brazil represented by six species. *Gaulettia* is characterised by the deeply reticulate venation on the lower leaf surface, often with stomatal cavities, the free, exserted stamens, and the unilocular ovary at the mouth of the receptacle.

DESCRIPTION

Leaf: abaxial indumentum prominent reticulate/stomatal-cavity; **shape** oblong-elliptic. **Inflorescence:** type paniculate/racemose. **Flower:** stamen insertion semi circular; **stamen number** 35 - 40. **Fruit:** epicarp glabrous/verrucose.

ADDITIONAL DESCRIPTION

Shrub 1-4 m tall. Branches appressed lanate pubescent when young, becoming glabrous with age. Leaves: stipules caducous; petioles 4-5 mm long, lanate when young, rugulose, terete, eglandular; lamina oblong to oblong-elliptic, coriaceous, 2.5-6 x 1.5-3.2 cm, rounded at base, acute or bluntly acuminate at apex, glabrous above, prominently reticulate beneath with conspicuous deep stomatal cavities filled with short grey pubescence; midrib prominent and sparsely lanate beneath, slightly impressed above; primary veins 9-10 pairs, prominent and lanate beneath, plane to slightly impressed above. Inflorescences of few-branched panicles or racemes, axillary and terminal; rachis and branches brown-tomentellous. Bracts and bracteoles ovate, caducous, tomentellous on both surfaces. Receptacle campanulate-turbinate, 3-4 mm long, tomentellous on exterior, glabrous within except for deflexed hairs at throat. Calyx lobes 5, acute, 2 mm long, tomentellous on both surfaces. Petals 5, white, glabrous. Stamens 35-40, inserted around 1/2 of circle. Ovary densely villous. Style glabrous except for deflexed hairs at base. Fruit globose, 5 cm diam.; epicarp glabrous, lenticellate; pericarp 2-2.5 mm thick, hard, woody, tomentose within.

DESCRIPTION

Leaf: abaxial indumentum prominent reticulate/pubescent; **shape** ovate/oblong-elliptic. **Inflorescence:** type racemose. **Flower:** stamen insertion complete circular; **stamen number** 40 - 51. **Fruit:** epicarp velutinous.

ADDITIONAL DESCRIPTION

Shrub or small tree to 10 m tall. Leaves: stipules 3-8 mm long, linear, persistent; petioles 6-11 mm long, with dense ferrugineous pubescence; lamina ovate to oblong elliptic, 8.5-18 x 3-8 cm, rounded to subcuneate at base, short-acuminate at apex with acumen 2.5-12 mm long, glabrous above, prominently reticulate beneath with short grey-brown pubescence between reticulations; primary veins 10-15 pairs, prominent beneath, slightly impressed above; midrib impressed, usually pubescent above. Inflorescences densely-flowered axillary racemes; rachis and branches ferrugineous-hirtellous. Bracts and bracteoles 2.5-7 mm long, persistent. Receptacle subcampanulate-cylindrical, 5.5-10 mm long, dense ferrugineous-brown pubescent on exterior, glabrous within except for deflexed hairs at throat; pedicels c. 1 mm long. Calyx lobes acute, hirsute on exterior. Petals 5, white, glabrous on margins. Stamens 40-51, inserted in a nearly complete circle, with a short row of toothed staminodes opposite. Ovary densely villous. Style pubescent at base only. Fruit round to oblong, 3.5-5 x 2.5-3.5 cm; epicarp short-velutinous; endocarp thin, fragile, granular, sparsely-pubescent within.

DESCRIPTION

Leaf: abaxial indumentum prominent reticulate/lanate pubescent; **shape** lanceolate. **Inflorescence:** type paniculate. **Flower:** stamen insertion unilateral; **stamen number** 12 - 25. **Fruit:** epicarp glabrous/verrucose.

ADDITIONAL DESCRIPTION

Shrub or small tree 1-10 m tall (rarely large trees). Leaves: stipules to 9 mm long, linear-filamentous, deciduous; petioles 2 mm long, densely pubescent; lamina oblong to oblong-lanceolate, 2.5-6 (-15) × 1-2 (-4.5) cm, cuneate to rounded at base, acuminate at apex with acumen 2-12 mm long, glabrous or sparsely appressed-pubescent above, with grey- to brown-lanate pubescence beneath which usually obscures the prominently reticulate parallel venation; midrib prominent beneath, impressed above, pubescent on both surfaces; primary veins 7-10 (-15) pairs, prominent beneath. Inflorescences terminal panicles; rachis and branches brown-villous. Bracts and bracteoles lanceolate, to 6 mm long, caducous. Receptacle cylindrical, curved anteriorly, 5-8 mm long, reddish-brown and often villous on exterior, glabrous within except for deflexed hairs at throat; pedicels 1-3 mm long. Calyx lobes acute. Petals 5, white or pale pink, glabrous. Stamens 12-25, unilateral, with a few teeth-like staminodes opposite. Ovary villous. Style pubescent. Fruit globose; epicarp pubescent when young, verrucose and glabrous when mature; pericarp hard and thick, undifferentiated, densely lanate within.

Gaulettia elata (Ducke) Sothers & Prance

Has as synonym

basionym *Couepia elata* Ducke

DESCRIPTION

Leaf: abaxial indumentum prominent reticulate/pubescent; **shape** ovate. **Inflorescence:** type racemose. **Flower:** stamen insertion semi circular; **stamen number** 35 - 40. **Fruit:** epicarp glabrous/verrucose.

ADDITIONAL DESCRIPTION

Large tree. Leaves: stipules minute; petioles 4-6 mm long, shortly pubescent; lamina ovate 4-7 x 2.5-3 cm, obtuse to subcuneate at base, caudately acuminate at apex with acumen 6-9 mm long, glabrous above, prominently reticulate beneath with silver-grey pubescence between reticulations; midrib impressed above, pubescent on lower portion; primary veins 6-8 pairs, prominent beneath. Inflorescences terminal and axillary few flowered lax racemes, with short grey-pubescent. Bracts and bracteoles minute, caducous. Receptacle obconical-turbinate, 4-5 mm long, sparsely pubescent on exterior, glabrous within except for deflexed hairs at throat; pedicels 2.5-3.5 mm long. Calyx lobes acute. Petals 5, white, glabrous on margins, deciduous. Stamens 35-40, inserted in 1/2 a circle, with a row of short-toothed staminodes opposite. Ovary densely villous. Style glabrous except at base. Fruit globose, 5-6 cm diameter; epicarp densely verrucose; mesocarp thick; endocarp fragile, thick, granular.

DESCRIPTION

Leaf: abaxial indumentum prominent reticulate/pubescent; **shape** oblong-elliptic. **Inflorescence:** type racemose. **Flower:** stamen insertion complete circular; **stamen number** 45 - 62. **Fruit:** epicarp velutinous.

ADDITIONAL DESCRIPTION

Trees to 20 m, or shrubs. Leaves: stipules 1.5-5 mm long, linear; petioles 2-9 mm long; lamina oblong or oblong-elliptic, 5-15.5 x 1.7-5.8 cm, acuminate at apex with acumen 5.5-18 mm long, rounded to cuneate at base, glabrous above, prominently reticulate beneath, with silver-grey pubescence between reticulations; midrib impressed, pubescent above; primary veins 10-15 pairs, prominent beneath, slightly impressed above. Inflorescences racemes of 5-21 flowers, or rarely flowers solitary; rachis with ferruginous-brown pubescence. Bracts and bracteoles 2-6 mm long, linear, persistent. Receptacle slender, tubular, 11-22 mm long, with thick dense hirtellous pubescence and some longer hairs on exterior, glabrous within or with hairs nearly to base on proximal side beneath ovary only; pedicels 1-3 mm long. Calyx lobes acute. Petals 5, white, glabrous on margins. Stamens 45-62, inserted almost in a complete circle, with a short portion of toothed staminodes. Ovary densely villous. Style sparsely pubescent at base. Fruit globose, c. 2.5 cm diameter; epicarp soft yellow-brown velutinous; endocarp thin, fragile, granular in texture, sparsely hirsute within.

DESCRIPTION

Leaf: abaxial indumentum prominent reticulate/stomatal-cavity; shape elliptic/oblong-elliptic. **Inflorescence:** type paniculate.

Flower: stamen insertion unilateral; **stamen number** 24 - 30. **Fruit:** epicarp glabrous/verrucose.

ADDITIONAL DESCRIPTION

Tree to 30 m. Leaves: stipules c. 1.5 mm long, caducous; petioles 8-12 mm long, with 2 sessile glands near to lamina base; lamina elliptic to oblong, 5-18.5 x 2-7.5 cm, rounded to cuneate at base, acuminate at apex with acumen 4.5-20 mm long, glabrous above, prominently reticulate beneath, or with stomatal cavities, with short appressed grey pubescence; midrib prominent beneath, slightly impressed above; primary veins 8-12 pairs, prominent beneath, slightly impressed above. Inflorescences little branched densely-flowered panicles; rachis and branches with short brown tomentellous pubescence. Bracts and bracteoles ovate to oblong, 2-6 mm long, caducous. Receptacle cylindrical-turbinate, 5-7.5 mm long, with a short brown pubescence on exterior, glabrous within except for deflexed hairs at throat. Calyx lobes rounded to acute. Petals 5, white, exceeding calyx lobes, glabrous on margins. Stamens 24-30, unilateral, with a smooth glabrous untoothed portion of the circle opposite them. Ovary densely villous. Style pubescent at base only. Fruit elliptic, pointed at apex, 3-4.5 x 2-3.5 cm; epicarp verrucose; pericarp undifferentiated, rather fragile, sparsely pubescent within.

DESCRIPTION

Árvores de pequeno a médio porte, arbustos ou subarbustos. Ramos jovens glabrescentes ou pilosos, frequentemente lenticelados. Folhas com lâmina glabrescente ou pilosa, frequentemente com glândulas discoides esparsas ou concentradas na base e/ou no ápice; pecíolo eglandular; estípulas laterais subpersistentes, raramente com glândulas na margem. Inflorescências em racemos eretos ou pendentes, ocasionalmente glomeriformes, ou em panículas pouco a muito ramificadas, ocasionalmente corimbiformes; pedicelos 0,5 a 20 mm compr.; brácteas e bractéolas com ou sem glândulas sésseis ou estipitadas, as bractéolas às vezes reduzidas a uma ou duas glândulas estipitadas inseridas no pedicelo. Flores bissexuadas, zigomorfas; receptáculo campanulado a tubular, levemente giboso, internamente glabro exceto por tricos reflexos próximos à extremidade; disco nectarífero formando um anel bem definido na borda do receptáculo; cálice 5-mero, sépalas com ou sem glândulas diminutas na margem, externamente pilosas ou glabrescentes, internamente glabras; corola 5-mera, pétalas caducas, glabras, brancas a róseas, lilases ou azuladas; estames 3–9, dispostos unilateralmente, inseridos na margem do disco nectarífero, exsertos, filetes livres, glabros, completamente brancos ou parcialmente róseos, lilases ou azulados; estaminódios filiformes ou denticulados opostos aos estames frequentemente presentes; ovário inserido no ápice do receptáculo, 1-carpelar, 1-locular, estilete parcialmente piloso. Drupas carnosas, epicarpo liso, glabrescente ou piloso, endocarpo delgado, com 4–7 linhas longitudinais de deiscência germinativa, frequentemente visíveis no epicarpo dos frutos imaturos ou de material herborizado.

COMMENTS

Hirtella é o maior gênero de Chrysobalanaceae, com 110 espécies, das quais 108 ocorrem em regiões tropicais e subtropicais das Américas, e duas no leste da África e Madagascar. Estudos filogenéticos utilizando sequências de DNA demonstraram que as duas espécies de *Hirtella* encontradas no continente africano não pertencem ao mesmo clado que as espécies neotropicais, e sugerem então o reestabelecimento do gênero *Thelira* para acomodá-las (Bardon *et al.* 2016, Chave *et al.* 2020). No Brasil, são registradas 68 espécies de *Hirtella*, constituindo o segundo gênero de Chrysobalanaceae mais representativo no país.

IDENTIFICATION KEY1. Leaf base with myrmecophilous swellings...**2**1'. Leaf base without myrmecophilous swellings...**6**2. Inflorescence glomeruliform racemes, sometimes cauliflorous...**3**2'. Inflorescence an elongate raceme or panicle, never cauliflorous...**4**3. Stamens 4-5; leaves 9-19 cm long, cartaceous to coriaceous, lower surface bullate...*H. myrmecophila*3'. Stamens 6; leaves 17-30 cm long, membranaceous, lower surface slightly bullate or plane...*H. physopora*4. Inflorescence a panicle, with many small lateral branches; leaves ovate; bracteoles with stipitate glands...*H. dorvalii*4'. Inflorescence an elongate raceme; leaves oblong, elliptic or lanceolate; bracteoles eglandular...**5**5. Young branches hispid, flowers with exterior of receptacle and calyx lobes hirsute; stamens 4-5...*H. guainiae*5'. Young branches hispid to glabrescent, flowers with exterior of receptacle and calyx lobes hispid; stamens 5-8...*H. duckei*6. Inflorescence paniculate...**7**6'. Inflorescence racemose...**42**7. Bracts and/or bracteoles glandular, with either sessile or stipitate glands (bracteoles sometimes reduced to one or two solitary stalked glands arising from pedicels)...**8**7'. Bracts, bracteoles and pedicels eglandular...**28**8. Leaves glabrescent beneath when mature...**9**8'. Leaves hirsute beneath when mature, at least on principal venation...**17**9. Stamens 5-7...**10**9'. Stamens 3...**14**

10. Inflorescence a long rachis bearing clusters of 1-3 flowers on short branches giving a racemose appearance, bracts and bracteoles with few sessile glands only...**11**
 10'. Inflorescence spreading, with many distinct lateral branches, flowers not in distinct clusters; bracts and bracteoles with stipitate glands...**12**
11. Inflorescences 10-25 cm long, rachis and flower exterior hirsute, pedicels 0,5-1 mm long...*H. araguaricensis*
 11'. Inflorescences 8-12 cm long, rachis and flower exterior glabrescent, pedicels 4-7 mm long...*H. barnebyi*
12. Inflorescence corymbose, rachis and flower exterior glabrescent...*H. insignis*
 12'. Inflorescence panicle, rachis and flower exterior pubescent...**13**
13. Bracteoles with a single stipitate gland on apex, enclosing buds in small groups; stamens 5-6...*H. suffulta*
 13'. Bracteoles with numerous stalked glands, not enclosing buds in small groups; stamens 6-7...*H. ulei*
14. Bracteolar glands few, usually either sessile or shortly stipitate on margins, or a single gland terminating apex...**15**
 14'. Bracteolar glands numerous, stipitate...**16**
15. Leaves 10-15 cm long; bracts membranous, with several sessile or shortly stipitate glands on margins; inflorescence 7-18 cm long...*H. tocantina*
 15'. Leaves 4-9 cm long; bracts coriaceous, with single sessile apical gland; inflorescence 3-11 cm long...*H. piresii*
16. Leaves 1.8-4.5 cm long, rounded to acuminate at apex, thickly coriaceous; primary veins 4-7 pairs...*H. bahiensis*
 16'. Leaves 6-13.5 cm long, acuminate at apex, thinly coriaceous; primary veins 9-10 pairs...*H. davisii*
17. Calyx lobes with small stipitate glands...**18**
 17'. Calyx lobes eglandular...**20**
18. Leaves 3-6.5 cm long, retuse to mucronate at apex (rarely acuminate); trunk with corky bark; receptacle pubescent within to base...*H. ciliata*
 18'. Leaves 4.5-23 cm long, acute to acuminate at apex; trunk with thin bark; receptacle glabrous within except at throat...**19**
19. Venation of leaves prominulous above; inflorescence subcorymbose, bearing numerous tightly clustered flowers; stamens 7...*H. hoehnei*
 19'. Venation of leaves impressed or prominulous above; inflorescence lax, spreading, not subcorymbose, with flowers loosely arranged; stamens 5...*H. glandulosa*
20. Venation of leaves impressed above, or the leaf surface bullate...**21**
 20'. Venation of leaves prominulous or plane above, the leaf surface never bullate...**23**
21. Inflorescence and flowers rufous-tomentose; bracts bearing very few sessile glands, these often obscured by pubescence...*H. obidensis*
 21'. Inflorescence and flowers tomentellous to puberulous, not rufous; bracts bearing many obvious stalked or sessile glands...**22**
22. Leaf surface usually distinctly bullate; base usually subcordate...*H. bullata*
 22'. Leaf upper surface plane, but with impressed venation; base rounded to subcuneate...*H. tentaculata*
23. Exocarp tomentose; endocarp thick and fibrous; bracts with few inconspicuous sessile glands...*H. eriandra*
 23'. Exocarp glabrescent; endocarp thin and bony; bracts with many conspicuous stipitate glands...**24**
24. Inflorescence hirsute; bracteoles with short-stalked glands arising from their margins; gland secretory tip small, ellipsoid...*H. paniculata*
 24'. Inflorescence puberulous to tomentellous; bracteoles either reduced to numerous, long-stalked clavate glands arising from the junction of the pedicels with the stem, or ovate with glands borne on their margins; gland secretory tip large, flattened, forming an expanded head...**25**
25. Glands arising from junction of pedicel and stem, with a long slender stalk and a small secretory tip, clavate; young branches puberulous or sparsely tomentellous...*H. macrophylla*
 25'. Glands arising from the bracts, each gland with a thick stalk and a large secretory tip, flattened to form an expanded head; young branches with short dense compact pubescence...*H. glabrata*

28. Leaf apex retuse, rounded, or acute, never acuminate... **29**
 28'. Leaf apex distinctly acuminate, sometimes abruptly so and cuspidate... **31**
29. Stamens 5-6; leaf apex mostly rounded to retuse (or mucronate)... *H. punctillata*
 29'. Stamens 3; leaf apex acute... **30**
30. Subshrub, up to 1 m tall; leaves thick-coriaceous; inflorescence corymbose, to 3 cm long... *H. corymbosa*
 30'. Shrubs or trees, 3 to 20 m tall; leaves chartaceous; inflorescence a panicle lax and spreading, 3.5-17 cm long... *H. triandra*
31. Stamens 3... **32**
 31'. Stamens 4-7... **34**
32. Leaves lanceolate; inflorescence and exterior of flowers glabrescent... *H. barrosoi*
 32'. Leaves ovate, oblong or elliptic; inflorescence and exterior of flowers pubescent... **33**
33. Leaf apex distinctly cuspidate with a long acumen; inflorescences 1-4 cm long... *H. bicornis*
 33'. Leaf apex acuminate but never cuspidate; inflorescences 3.5-17 cm long... *H. triandra*
34. Inflorescence appearing racemose, but in fact either a long central rachis bearing groups of flowers on short branches, or with a few branches with only 3 flowers each... **35**
 34'. Inflorescence a much-branched panicle without a long central rachis... **38**
35. Bracteoles exceeding receptacle in length, persistent, enclosing buds; leaf base cuneate; exocarp glabrous... *H. suffulta*
 35'. Bracteoles much shorter than receptacle, not persistent, not enclosing buds; leaf bases subcordate to subcuneate; exocarp tomentose or glabrous... **36**
36. Leaves 18-40 x 8-16.5 cm, with 14-18 pairs of primary veins; 2 glands at junction of upper surface of lamina and petiole; inflorescence rufous-tomentellous... *H. magnifolia*
 36'. Leaves 8-23 x 3.3-8 cm, with 10-13 pairs of primary veins; lamina base eglandular; inflorescence grey-puberulous or brown-tomentellous... **37**
37. Leaves subcordate at base; lower lamina surface glabrescent; exocarp glabrous... *H. elongata*
 37'. Leaves rounded to subcuneate at base; lower lamina surface pubescent; exocarp tomentose... *H. eriandra*
38. Inflorescence and exterior of flowers tomentose or hirsute... **39**
 38'. Inflorescence and exterior of flowers grey-puberulous to glabrescent... **40**
39. Inflorescence and young branches sparsely hirsute to hirsute; leaves membranous... *H. rodriguesii*
 39'. Inflorescence and young branches tomentose; leaves chartaceous to coriaceous... *H. obidensis*
40. Lamina 9-15 cm long, with distinct basal glands; inflorescence lax and spreading, 7-19 cm long... *H. rasa*
 40'. Lamina 2-5.8 (-9.5) cm long, with base eglandular or with inconspicuous glands; inflorescence short and compact, 1.8 cm long... **41**
41. Inflorescence and exterior of flowers pubescent; leaves thick and coriaceous, with prominent venation; apex acuminate but never cuspidate... *H. scabra*
 41'. Inflorescence and exterior of flowers glabrescent to puberulous; leaves chartaceous, with plane to prominulous venation; apex acuminate to cuspidate... *H. bicornis*
42. Bracts and/or bracteoles glandular, with either sessile or stipitate glands (bracteoles sometimes reduced to one or two solitary stalked glands arising from pedicels)... **43**
 42'. Bracts, bracteoles and pedicels eglandular... **69**
43. Bracts and bracteoles bearing sessile glands only or with translucent glandular secretions; stipitate glands absent from bracts, bracteoles and pedicels... **44**
 43'. Either bracts or bracteoles bearing stipitate glands, or with 1 or more solitary stipitate glands arising from some pedicels... **52**
44. Leaves oblong-lanceolate... **45**

44'. Leaves oblong, elliptic or ovate...**46**

45. Leaves 9-14 cm long; pedicels 5-10 mm long; stipules eglandular...*H. tenuifolia*

45'. Leaves 5-8 cm long; pedicels 12-16 mm long; stipules with numerous stipitate glands...*H. radamii*

46. Young branches hirsute...**47**

46'. Young branches pubescent to glabrescent or tomentose...**48**

47. Flowers with pedicels 8-12 mm long, receptacle tubular, stamens 5-7...*H. racemosa*

47'. Flowers with pedicels 1.5-3 mm long, receptacle campanulate, stamens 3-6...*H. pilosissima*

48. Bracts and bracteoles caducous, with minute translucent secretions; pedicels 6-25 mm long...**49**

48'. Bracts and bracteoles persistent, with sessile glands only, without any translucent secretions; pedicels 1.5-10.5 mm long...**50**

49. Bracts with sessile glands in addition to translucent secretion; pedicels 6-16 mm long, thick; inflorescence 4.5-14 cm long; leaves sparsely pubescent on venation or glabrescent beneath...*H. gracilipes*

49'. Bracts with translucent glandular secretions only, other glands absent; pedicels 12-25 mm long, very slender; inflorescence 1.5-5 cm long; leaves glabrescent beneath...*H. brachystachya*

50. Primary veins 6-10 pairs; leaves 3.5-18.5 (-19.5) cm long, glabrescent or sparsely pubescent beneath; surface of mature leaves plane, not bullate...*H. racemosa*

50'. Primary veins 11-15 pairs; leaves 19.5-25 cm long or if smaller (7-13 cm long) then hirsutulous beneath; mature leaves slightly bullate...**51**

51. Leaves 15-25 cm long; primary veins 13-15 pairs; lower surface glabrescent...*H. juruensis*

51'. Leaves 6.5-13 cm long; primary veins 11-13 pairs; lower surface pubescent at least on midvein...*H. kuhlmannii*

52. Bracts and bracteoles eglandular, or with sessile glands and a glandular apex only; all or some pedicels with 1-2 stipitate glands...**53**

52'. Bracts and bracteoles with numerous stipitate glands; pedicels eglandular...**61**

53. Primary veins 17-19 pairs; leaves 19-26 cm long; pedicels 8-12 mm long...*H. longifolia*

53'. Primary veins 8-15 pairs; leaves 8-18 cm long (to 24 cm in 1 species with short pedicels 0.5-2 mm long); pedicels 0.5-9 mm long...**54**

54. Pedicels slender, 4.5-9 mm long (or if 3.5-5 mm then leaf constricted above base); leaves glabrous beneath except for pubescence on midrib and margin of extreme base of lamina; bracteoles eglandular or glandular...**55**

54'. Pedicels thick, 1-3 mm long; leaves hirsute beneath or glabrous with hirsute margin and midrib; bracteoles with glandular apex and often sessile glands...**58**

55. Leaves elliptic to oblong, 3.5-8 cm long; bracts usually with sessile and apical glands...*H. racemosa*

55'. Leaves oblong; narrowly oblong or oblanceolate, 8-18 cm long; bracts eglandular...**56**

56. Leaves subauriculate because of slight constriction above base; primary veins 11-13 pairs...*H. schultesii*

56'. Leaves not constricted above base; primary veins 8-15 pairs...**57**

57. Young branches hirsute; primary veins 12-15 pairs; secondary venation slightly impressed; stamens 4-5...*H. paraensis*

57'. Young branches sparsely hirsute to glabrescent; primary veins 8-10 pairs; tertiary venation prominulous; stamens 6...*H. sprucei*

58. Leaves bullate above, with distinctly impressed venation, secondary venation and reticulations extremely prominent beneath...*H. lancifolia*

58'. Leaves not bullate above, with venation prominent or plane, secondary venation and reticulations prominulous only beneath...**59**

59. Leaves acuminate at apex; lower surface glabrous to sparsely hirsute...*H. burchellii*

59'. Leaves usually mucronate at apex; lower surface densely hirsute or glabrous...**60**

60. Inflorescence densely tomentose; leaves mucronate at apex, hirsute beneath...*H. mucronata*

- 60'. Inflorescence puberulous; leaves acuminate at apex, glabrescent beneath...*H. racemosa*
61. Bracts and bracteoles enclosing flower buds; flowers with receptacle cylindrical, elongate...*H. couepiiflora*
 61'. Bracts and bracteoles not enclosing flower buds; flowers with receptacle campanulate to tubular...**62**
62. Leaves usually orbicular, rounded to retuse at apex; pedicels 7-20 mm long...*H. longipedicellata*
 62'. Leaves oblong to elliptic, acuminate at apex; pedicels 4-11 (-15) mm long...**63**
63. Stipules bearing numerous stipitate glands...*H. glandistipula*
 63'. Stipules eglandular...**64**
64. Young branches lanate; inflorescence short, compact, densely flowered; calyx bearing numerous glands; leaves drying grey...*H. martiana*
 64'. Young branches hirsute, hispid or glabrescent; inflorescence lax; calyx eglandular or the glands scarce; leaves drying green to brown...**65**
65. Young branches glabrescent; flowers with 3 stamens...*H. excelsa*
 65'. Young branches hirsute or hispid; flowers with 4-7 stamens...**66**
66. Shrub with scandent branches; young branches hispid; dried material with silver metallic sheen...*H. subscandens*
 66'. Shrubs or trees without scandent branches; young branches hirsute; dried material without silver metallic sheen...**67**
67. Leaves ovate, 2.5-6 cm long x 1.1-2.6 cm broad; inflorescence 3-5 cm long...*H. pimichina*
 67'. Leaves oblong, elliptic, and less frequently ovate, 5.5-21.5 cm long x 2.2-9 cm broad; inflorescence 4.5-20.5 cm long...**68**
68. Bracteoles linear-lanceolate, with long stalked glands; apices always terminating in a long stalked gland; stamens 4-5...*H. hispidula*
 68'. Bracteoles ovate to widely ovate, with sessile or short stipitate glands; stamens 5-7...*H. santosii*
69. Stamens 3-4...**70**
 69'. Stamens 5-9...**71**
70. Inflorescence short and clustered racemes; leaves slightly bullate, 8-12.5 cm long; fertile stamens 4, filaments far exceeding calyx lobes...*H. fasciculata*
 70'. Inflorescence of elongate racemes; leaves plane, 3.5-5.5 cm long; fertile stamens 3, filaments only slightly exceeding calyx lobes...*H. glaziovii*
71. Leaves usually orbicular, predominantly retuse to rounded at apex; pedicels 7-20 mm long...*H. longipedicellata*
 71'. Leaves ovate, oblong, elliptic or lanceolate, acuminate at apex; pedicels to 15 mm long, usually shorter...**72**
72. Lower surface of leaf hirsute or pubescent at least on primary and secondary venation...**73**
 72'. Lower surface of leaf glabrous or with few sparse short hairs on midrib...**77**
73. Young branches and inflorescences with a tomentose or velutinous indumentum of densely arranged trichomes, providing a characteristic yellowish-brown coloration...**74**
 73'. Young branches and inflorescences with a hirsute or pubescent indumentum, with no characteristic coloration...**75**
74. Young branches and inflorescences tomentose; stipules 3-7 mm long; leaves 2.5-9 cm wide, plane or slightly bullate on adaxial surface...*H. hebeclada*
 74'. Young branches and inflorescences velutinous; stipules 6-10 mm long; leaves 10.3-18 cm wide, strongly bullate on adaxial surface ...*H. prancei*
75. Young branches pubescent; leaves 3.5-5.5 cm wide; pedicel 2-3 mm long; stamens 5-7...*H. scaberula*
 75'. Young branches hirsute to densely hirsute; leaves 1.1-3.3 cm wide; pedicel 8-16 mm long; stamens 7-9...**76**
76. Leaves oblong or elliptic, venation deeply impressed above; inflorescences 3-9 cm long; flowers 4 mm long...*H. floribunda*
 76'. Leaves oblong, elliptic or lanceolate, venation plane above; inflorescences 8-23.5 cm long; flowers c. 6 mm long...*H. angustifolia*

77. Plants from the Atlantic rainforest in eastern Brazil...**78**

77'. Plants from the Amazon Basin...**79**

78. Petals slightly clawed, leaf base cuneate; young branches sparsely pubescent; inflorescence of densely crowded racemes, 3-5.5 cm long...*H. parviunguis*

78'. Petals not clawed; leaf base subcordate; young branches hirsute; inflorescence of slender racemes, 8-23.5 cm long...*H. angustifolia*

79. Shrubs 1.5-4 m tall; young branches sparsely pubescent; leaf apex rounded or acute...*H. arenosa*

79'. Trees up to 20 m tall; young branches sparsely hirsute; leaf apex caudate...*H. conduplicata*

Hirtella angustifolia Schott ex Spreng.

DESCRIPTION

Stem: indumentum shoot when young hirsute. **Leaf:** cavity myrmecophylous absent; **form blade** lanceolate/oblong/elliptic. **Inflorescence:** type racemose; **gland(s) on the bract(s)** absent; **gland(s) on the bracteole(s)** absent. **Flower:** number of the stamen 7/8.

ADDITIONAL DESCRIPTION

Diferencia-se de espécies morfológicamente próximas pelas folhas oblongas, elípticas ou lanceoladas, com 5-15 cm compr., nervação plana na face adaxial, e flores com ca. 6 mm compr.

Life Form

Shrub, Tree

Substrate

Terrestrial

DISTRIBUTION

Native, Is endemic from Brazil

Hirtella bicornis Mart. & Zucc.

This treatment is composed of the following taxa: *Hirtella bicornis*, *Hirtella bicornis* var. *bicornis*, *Hirtella bicornis* var. *pubescens*.

DESCRIPTION

Stem: indumentum shoot when young sparsely pubescent. **Leaf:** cavity myrmecophyllous absent; **form blade** ovate/oblong/elliptic. **Inflorescence:** type paniculate; **gland(s) on the bract(s)** absent; **gland(s) on the bracteole(s)** absent. **Flower:** number of the stamen 3/4/5.

ADDITIONAL DESCRIPTION

Diferencia-se de espécies morfologicamente próximas por apresentar folhas cartáceas, com ápice acuminado a cuspidado, base obtusa, arredondada ou cuneada, nervação plana a levemente saliente na face adaxial; inflorescências com 1-4 cm compr.; com a raque glabrescente a esparsamente pubescente; bractéolas mais curtas do que o receptáculo, e que não subtendem grupos de botões florais.

REFERENCE

Prance, G.T. 1972. Chrysobalanaceae. Flora Neotropica Monograph 9: 1-409.

Hirtella elongata Mart. & Zucc.

DESCRIPTION

Stem: indumentum shoot when young sparsely pubescent. **Leaf:** cavity myrmecophyllous absent; **form blade** oblong/elliptic. **Inflorescence:** type paniculate; **gland(s) on the bract(s)** absent; **gland(s) on the bracteole(s)** absent. **Flower:** number of the stamen 6/7.

ADDITIONAL DESCRIPTION

Diferencia-se de espécies morfológicamente próximas por apresentar base da lâmina foliar subcordada, inflorescência paniculada consistindo em uma longa raque central onde estão inseridos muitos ramos laterais curtos, bractéolas eglandulares, mais curtas do que o receptáculo, e que não subtendem grupos de botões florais.

Hirtella myrmecophila Pilg.

This treatment is composed of the following taxa: *Hirtella myrmecophila*, .

Has as synonym

heterotypic *Hirtella myrmecophila* var. *tetrandra* Huber

DESCRIPTION

Stem: indumentum shoot when young hispid. **Leaf:** cavity myrmecophyllous present; **form blade** lanceolate/oblong.

Inflorescence: type racemose glomeriform; **gland(s) on the bract(s)** sessile/absent; **gland(s) on the bracteole(s)** sessile/absent.

Flower: number of the stamen 4/5.

Life Form

Shrub, Tree

Substrate

Terrestrial

DISTRIBUTION

Native, Is endemic from Brazil

Phytogeographic Domains

Amazon Rainforest

Vegetation Types

Terra Firme Forest

Geographic Distribution

Confirmed occurrences

North (Amazonas, Pará)

Hymenopus (Benth.) Sothers & Prance

This treatment is composed of the following taxa: *Hymenopus*, *Hymenopus adolphoduckei*, *Hymenopus amapaensis*, *Hymenopus arachnoideus*, *Hymenopus caudatus*, *Hymenopus conferruminatus*, *Hymenopus divaricatus*, *Hymenopus glabriflorus*, *Hymenopus heteromorphus*, *Hymenopus hirsutus*, *Hymenopus intrapetiolaris*, *Hymenopus krukovii*, *Hymenopus laevigatus*, *Hymenopus latifolius*, *Hymenopus macrophyllus*, *Hymenopus miltonii*, *Hymenopus oblongifolius*, *Hymenopus occultans*, *Hymenopus prismatocarpus*, *Hymenopus reticulatus*, *Hymenopus sothersiae*.

HOW TO CITE

Sothers, C.A., Prance, G.T. 2020. *Hymenopus* in **Flora do Brasil 2020**. Jardim Botânico do Rio de Janeiro. Available at: <http://floradobrasil.jbrj.gov.br/reflora/floradobrasil/FB604710>.

DESCRIPTION

Trees or shrubs. Leaves: stipules caducous or persistent; petiole with pair of glands present or not; lower surface glabrous or hirsute. Inflorescences panicles or racemose panicles. Bracts and bracteoles small, persistent to subpersistent, not enclosing flower-buds. Flowers bisexual, sub-actinomorphic. Receptacle-tube campanulate, turbinate or urceolate, hairy inside, but throat without long retrorse hairs. Sepals 5. Petals 4-5. Stamens 3-10, inserted unilaterally, in $\frac{3}{4}$ of a circle or in a complete circle, equal or shorter than calyx, rarely exserted; filaments free, connate either at base only, to $\frac{1}{2}$ length or fully connate. Ovary 1-carpellary, 1-locular, inserted at base of receptacle; style filiform, indistinctly 3-lobed at apex. Fruit a drupe to 9×8 cm, epicarp costate, smooth, glabrous, lenticellate, or pilose; endocarp glabrous or sparsely puberulous within; endocarp thick, hard and woody, or thin and fibrous, without any special mechanisms for seedling escape.

COMMENTS

A genus of 28 species, of which 20 occur in Brazil. Distributed from Central America, Trinidad and Tobago, to northern South America and Amazonia, with a few representatives in northeastern and southeastern Brazil. Absent from Mexico. *Hymenopus* is characterised by the glabrous or hirsute leaves, the presence of petals, mostly included stamens, basal and unilocular ovary. In phylogenetic analyses the genus is recovered in a clade with *Afrolicania*, *Cordillera* and *Parinariopsis*; this clade is sister to *Hirtella*.

IDENTIFICATION KEY

- 1 Leaf lower surface sparsely hirsute at least on venation or hispid on midrib.
 - 2 Receptacle urceolate; leaf apex rounded to apiculate..... **H. latifolius**
 - 2' Receptacle campanulate; leaf apex acuminate or rarely acute.
 - 3 Midrib distinctly impressed on leaf upper surface; pedicels 0.5 mm long..... **H. amapaensis**
 - 3' Midrib plane above; flowers sessile.
 - 4 Stamens 5; petioles 10 mm long; leaves chartaceous..... **H. krukovi**
 - 4' Stamens 6-9; petioles 1.5-5 mm long; leaves coriaceous or membranaceous.
 - 5 Inflorescence branches hirsute; leaf apex acuminate; petioles eglandular..... **H. hirsutus**
 - 5' Inflorescence branches puberulous; leaf apex retuse to acute; petioles 2-glandular..... **H. heteromorphus**
 - 1' Leaf lower surface glabrous
 - 6 Midrib distinctly impressed on leaf upper surface.
 - 7 Leaves 21-31 x 8.5-11.5; petioles 10-13 mm long; stipules 10-13 mm long;
 inflorescence branches sparsely puberulous..... **H. conferruminatus**
 - 7' Leaves 5-19 x 2.4-8.5; petioles 2-8 mm long; stipules 1-5 mm long. inflorescence
 branches hirsute or tomentellous.
 - 8 Flower pedicels c. 2 mm long; leaves submembranaceous..... **H. glabriflorus**
 - 8' Flowers sessile; leaves coriaceous.
 - 9 Leaf apex rounded to apiculate; petioles 3-6 mm long..... **H. prismatocarpus**
 - 9' Leaf apex acuminate; petioles 7-8mm long..... **H. hirsutus**
 - 6' Midrib plane or prominulous on leaf upper surface.
 - 10 Flowers pedicellate
 - 11 Leaf base cordate, subcordate or rounded.
 - 12 Stipules 6-15 mm long; flowers 2.5-3 mm long; leaves 13-40 cm long..... **H. macrophyllus**
 - 12' Stipules 3-5 mm long; flowers 1.5-2 mm long; leaves 6-17 mm long..... **H. oblongifolius**
 - 11' Leaf base cuneate or subcuneate.
 - 13 Flowers borne in small pedunculate cymules.
 - 14 Petioles with 2 glands; stamens 6-7; stipules caducous..... **H. reticulatus**
 - 14' Petioles eglandular; stamens 5; stipules persistent..... **H. adolphoduckei**
 - 13' Flowers not grouped into cymules; petioles eglandular.
 - 15 Receptacle urceolate; leaves 9-18 cm long; leaf apex acuminate..... **H. laevigatus**
 - 15' Receptacle campanulate; leaves 4-11 cm long; leaf apex caudate or cuspidate.
 - 16 Stipules persistent; stamens 5..... **H. miltonii**
 - 16' Stipules caducous; stamens 6-8.
 - 17 Primary leaf veins 8-9 pairs; leaves 8-11 cm long, subcoriaceous... **H. caudatus**
 - 17' Primary leaf veins 5-7 pairs; leaves 4.5-8 cm long chartaceous.... **H. occultans**
 - 10' Flowers sessile.
 - 18 Receptacle urceolate; stipules 10-30 mm long..... **H. arachnoideus**
 - 18' Receptacle campanulate; stipules 1.5-15 mm long
 - 19 Stipules adnate to petiole base; leaf apex acuminate..... **H. divaricatus**
 - 19' Stipules axillary; leaf apex retuse to acute.
 - 20 Primary leaf veins plane on upper surface; stipules 1.5-3.5 mm long.
 - **H. heteromorphus**
 - 20' Primary leaf veins prominulous on leaf upper surface; stipules 5-15 mm long.
 - 21 Primary leaf veins 8-12 pairs; leaf apex acute; stamens 5..... **H. intrapetiolaris**
 - 21' Primary leaf veins 6-7 pairs; leaf apex retuse; stamens 6-7..... **H. sothersiae**

Hymenopus adolphoduckei (Prance) Sothers & Prance

Has as synonym

basionym *Licania adolphoduckei* Prance

DESCRIPTION

Leaf: abaxial glabrous; **shape** oblong; **petiole gland(s)** absent. **Inflorescence:** type racemose/panicle. **Flower:** stamen included; **pedicel** pedicellate; **receptacle** campanulate. **Fruit:** exocarp glabrous/lenticellate; **shape** ovoid.

ADDITIONAL DESCRIPTION

Trees to 15 m tall. Branches glabrous when young. Leaves: stipules axillary, c. 2 mm long, persistent; petioles 4-6 mm long, glabrous, rugose, eglandular, with lamina base slightly confluent; lamina oblong, coriaceous, 8-13.5 × 3.5-6.5 cm, cuneate at base, acuminate at apex with acumen 3-10 mm long, glabrous on both surfaces, with scattered glands beneath; midrib prominulous above, prominent and glabrous beneath; primary veins 12-16 pairs, prominulous on both surfaces, 7-11 mm between veins. Inflorescences of terminal and subterminal racemose panicles; rachis sparsely puberulous. Bracts and bracteoles c. 1 mm long, ovate, persistent, chartaceous, puberulous on exterior. Flowers c. 1.5 mm long, borne in few-flowered cymules attached to rachis and primary branches by short peduncles. Receptacle campanulate, sparsely grey puberulous on exterior, tomentose within; pedicels 0.5-1 mm long. Calyx lobes 5, triangular, puberulous on exterior. Petals 5, sparsely puberulous on exterior. Stamens 5, inserted around complete circle; filaments shorter than calyx lobes, glabrous, united at mid point; anthers deltoid. Ovary puberulous; style puberulous on lower portion. Fruit ovoid, 6-8 cm long, 4-5 cm broad, constricted near base; exocarp glabrous, lenticellate; mesocarp 1-2 mm thick; endocarp thin, 0.5 mm thick, bony, glabrous within.

DESCRIPTION

Leaf: abaxial hirsute; **shape** oblong; **petiole gland(s)** present. **Inflorescence:** type panicle. **Flower:** stamen unknown; pedicel pedicellate; receptacle campanulate. **Fruit:** exocarp unknown; shape unknown.

ADDITIONAL DESCRIPTION

Trees to 10 m tall. Branches hispid tomentose when young. Leaves: stipules axillary, membranous, lanceolate, persistent, tomentellous; petioles 10-16 mm long, terete, hispid-tomentose, with 2 sessile glands; lamina chartaceous, oblong, 15-33 × 4.5-9.5 cm, acuminate at apex with acumen 3-15 mm long, cuneate at base, hirsute and glandular beneath; midrib plane above, prominent and sparsely hirsute beneath; primary veins 13-17 pairs, impressed above, prominent and sparsely hirsute beneath. Inflorescences terminal and subterminal panicles; rachis and branches ferrugineous-tomentose; bracts and bracteoles oblong to linear, persistent, tomentose; pedicels c. 0.5 mm long. Flowers 3-4 mm long. Receptacle campanulate, tomentose outside, tomentose within. Calyx lobes acute, tomentose outside. Petals 5, glabrous. Stamens 10, inserted around 3/4 of circle; filaments glabrous; anthers deltoid. Ovary pilose. Style puberulous. Fruit unknown.

Hymenopus arachnoideus (Fanshawe & Maguire) Sothers & Prance

Has as synonym

basionym *Licania arachnoidea* Fanshawe & Maguire

DESCRIPTION

Leaf: abaxial glabrous; **shape** oblong/lanceate; **petiole gland(s)** present. **Inflorescence:** type racemose/panicle. **Flower:** stamen exserted; **pedicel** sessile; **receptacle** urceolate. **Fruit:** exocarp unknown; **shape** unknown.

ADDITIONAL DESCRIPTION

Tree, medium-sized. Branches puberulous when young, soon becoming glabrous. Leaves with stipules linear, 10-30 mm long, submembranous, axillary, persistent; petioles 7-9 mm long, glabrous, canaliculate, rugose, with 2 disc-shaped, medial glands above; lamina narrowly oblong-lanceolate with parallel sides, coriaceous, 17-25 × 4.5-7 cm, acuminate to acute at apex with acumen to 11 mm long, rounded at base, glabrous on both surfaces; palisade glands absent; midrib prominent and glabrous above; primary veins 12-14 pairs, prominulous above, prominent beneath. Inflorescences axillary racemose panicles, ramiflorous; rachis and branches sparsely arachnoid. Flowers 3.5-4 mm long, in dense glomerules on primary branches of inflorescence. Primary bracts ovate, to 8 mm long; other bracts and bracteoles 1-3 mm long, persistent, pubescent on exterior, glabrous within, often slightly serrate. Receptacle narrowly urceolate, sessile, densely arachnoid on exterior, lanate within. Calyx lobes acute, pubescent on exterior, glabrous within. Petals 5, densely pubescent, some shortly unguiculate. Stamens 5 fertile, inserted in a complete circle, with c. 4 sterile staminodes; filaments slightly exceeding calyx lobes, connate for 1/2 of length, with a dense lanate mass surrounding them and filling the mouth of the receptacle. Ovary lanate-tomentose. Style pubescent throughout, equalling filaments. Fruit unknown.

Has as synonym

basionym *Licania caudata* Prance

DESCRIPTION

Leaf: abaxial glabrous; **shape** elliptic/ovate; **petiole gland(s)** absent. **Inflorescence:** type racemose/panicle. **Flower:** stamen equal; **pedicel** pedicellate; **receptacle** campanulate. **Fruit:** exocarp glabrous/smooth; **shape** oblong.

ADDITIONAL DESCRIPTION

Trees. Branches glabrous, lenticellate when young. Leaves: stipules caducous (not seen); petioles 5-7 mm long, glabrous, eglandular, weakly canaliculate; lamina subcoriaceous, ovate-elliptic, 8-11 × 3.5-5.5 cm, acuminate at apex with acumen 7-9 mm long, cuneate at base, glabrous on both surfaces; midrib prominulous and glabrous above, primary veins 8-9 pairs, plane above, prominent beneath. Inflorescences terminal and axillary racemose panicles; rachis and branches glabrous or sparsely hirsutulous; bracts and bracteoles minute, lanceolate, caducous; pedicels c. 0.5 mm long. Flowers 2 mm long; receptacle campanulate, sparsely hirsute on exterior, tomentose within. Calyx lobes acute, sparsely hirsutulous on both surfaces. Petals 5, sparsely pubescent. Stamens 7 or 8, inserted in a complete circle; filaments glabrous, connate for 1/2 of length, equalling calyx lobes. Ovary tomentose. Style equalling calyx lobes, pubescent to apex. Fruit oblong, 25 × 8 mm; exocarp smooth and glabrous, often slightly rugulose, wrinkled when dry; mesocarp thin, 0.25 mm thick, fleshy; endocarp thin (0.5 mm), bony, slightly puberulous within.

DESCRIPTION

Leaf: abaxial glabrous; **shape** oblong-elliptic; **petiole gland(s)** absent. **Inflorescence:** type racemose/panicle. **Flower:** stamen unknown; **pedicel** sessile; **receptacle** campanulate. **Fruit:** exocarp unknown; **shape** unknown.

ADDITIONAL DESCRIPTION

Tree 12 m tall. Branches sparsely short-puberulous when young. Leaves with stipules lanceolate, 10-13 mm, early caducous; petioles 10-13 mm long, sparsely appressed puberulous, terete, eglandular; lamina oblong-elliptic, chartaceous, 21-31 × 8.5-11.5 cm, cuneate at base, acuminate at apex with acumen 4-8 mm long, glabrous on both surfaces except on midrib which is slightly impressed above, prominent, with short sparse puberulous pubescence beneath; primary veins 10-13 pairs, slightly impressed above, prominent beneath, widely spaced, 1.5-4.5 cm apart. Inflorescences of axillary racemose panicles; rachis and branches sparsely puberulous. Bracts and bracteoles minute, to 1-3 mm long, persistent, puberulous on exterior. Flowers c. 1.5 mm long, sessile, borne on primary and secondary branches of inflorescence. Receptacle campanulate, sparsely puberulous on exterior, tomentellous within. Calyx lobes 5, acute, puberulous on exterior. Petals 5, with ciliate margins. Stamens 5 fertile; filaments connate almost to apex forming a ring on which anthers are inserted. Ovary sparsely pilose. Style sparsely hirsute, included. Fruit not seen.

DESCRIPTION

Leaf: abaxial glabrous; **shape** elliptic/oblong-elliptic; **petiole gland(s)** present. **Inflorescence:** type panicle. **Flower:** stamen included; **pedicel** subsessile; **receptacle** campanulate. **Fruit:** exocarp glabrous/smooth; **shape** ovoid.

ADDITIONAL DESCRIPTION

Trees to 18 m tall; trunk often with stilt roots. Branches puberulous when young, soon becoming glabrous and lenticellate. Leaves: stipules lanceolate, coriaceous, to 4 mm long, adnate to petiole base, subpersistent; petioles 5-9 mm long, glabrous, terete, with 2 sessile glands near lamina base; lamina elliptic to oblong-elliptic, thick-coriaceous, 9-27 × 4.5-10 cm, abruptly short-acuminate at apex with acumen 2-10 mm long, subcuneate at base, glabrous on both surfaces; palisade glands present; midrib plane to slightly impressed above, glabrous; primary veins 6-7 pairs, extremely prominent beneath, inconspicuous above. Inflorescences predominantly axillary panicles; rachis and branches sparsely appressed-hirsutulous. Flowers c. 1.5 mm long, solitary but densely crowded on primary and secondary branches of inflorescence. Bracts and bracteoles 0.5-2 mm long, oblong to lanceolate, hirsutulous, persistent. Receptacle campanulate, almost sessile, sparsely hirsutulous on exterior, sparsely pubescent within. Petals 5, pubescent, not clawed. Stamens 7, inserted in a complete circle; filaments slightly shorter than calyx lobes, connate for 1/3 of length, glabrous. Ovary villous. Style equaling filaments, hirsute throughout. Fruit ovoid; epicarp smooth, glabrous, drying black; mesocarp thin, fleshy; endocarp thin, granular, fragile, glabrous within.

Hymenopus glabriflorus (Prance) Sothers & Prance

Has as synonym

basionym *Licania glabriflora* Prance

DESCRIPTION

Leaf: abaxial glabrous; **shape** oblong/oblong-elliptic; **petiole gland(s)** absent. **Inflorescence:** type panicle. **Flower:** stamen equal; **pedicel** pedicellate; **receptacle** campanulate. **Fruit:** exocarp lenticellate; **shape** ellipsoid.

ADDITIONAL DESCRIPTION

Trees, small to medium sized. Branches hirsutulous when young, soon becoming glabrous and lenticellate. Leaves: stipules lanceolate, to 3.5 mm long, persistent, axillary, hirsutulous; petioles 2-5 mm long, terete, eglandular, hirsute to hirsutulous; lamina submembranous, oblong to oblong-elliptic, 7-11 × 2.5-4.2 cm, acuminate at apex with acumen 5-9 mm long, cuneate at base, glabrous on both surfaces, usually with paired glands on lower surface above insertion of petiole; midrib prominulous above, hirsutulous, soon becoming glabrous; primary veins 8-10 pairs, impressed above, prominent beneath. Inflorescences axillary (rarely terminal) panicles; rachis and branches sparsely hirsute; bracts and bracteoles minute, lanceolate, caducous. Flowers shortly pedicellate, c. 2 mm long. Receptacle campanulate, hirsutulous on exterior, tomentose within. Calyx lobes acute, sparsely hirsutulous. Petals 5, densely pubescent. Stamens 5, inserted around 3/4 of circle; filaments glabrous, connate halfway, as long as calyx lobes. Ovary pilose. Style equalling calyx lobes, hirsute. Fruit narrowly ellipsoid, 4.8 × 2 cm; exocarp abundantly lenticillate; endocarp hard, woody, c. 1.5 mm thick, glabrous within.

Hymenopus heteromorphus (Benth.) Sothers & Prance

This treatment is composed of the following taxa: *Hymenopus heteromorphus*, *Hymenopus heteromorphus* var. *glabrus*, *Hymenopus heteromorphus* var. *heteromorphus*, *Hymenopus heteromorphus* var. *revolutus*, *Hymenopus heteromorphus* var. *subcordatus*.

Has as synonym

basionym *Licania heteromorpha* Benth.

DESCRIPTION

Leaf: abaxial glabrous; **shape** elliptic/oblong/lanceate/orbicicular; **petiole gland(s)** present. **Inflorescence:** type racemose/panicle. **Flower:** stamen included; pedicel subsessile/sessile; receptacle campanulate. **Fruit:** exocarp glabrous/smooth/velutinous/verrucose/pubescent/costate; **shape** globose/oblong.

ADDITIONAL DESCRIPTION

Trees to 30 m tall, occasionally slightly buttressed. Branches hispid or puberulous when young, soon becoming glabrous. Leaves: stipules 1.5-3.5 mm long, membranous, subpersistent or caducous, linear; petioles 2-12 mm long, glabrous when mature, usually shallowly canaliculate, less often terete, most frequently bearing 2 protruding prominent medial glands, rarely eglandular; lamina elliptic-orbicicular to oblong-lanceolate coriaceous, 4.5-22 × 2-10 cm, most frequently rounded at apex but varying from retuse to acute or bluntly acuminate, rounded to cuneate or rarely subcordate at base, glabrous on both surfaces; midrib prominulous above, glabrous; primary veins 6-12 pairs, plane or nearly so above, prominent beneath. Inflorescences terminal and subterminal racemose panicles; rachis and branches puberulous to tomentellous. Flowers 1.5-3 mm long, in small groups along primary and secondary branches of inflorescence, sessile or subsessile. Bracts and bracteoles 0.3-2 mm long, linear to ovate, persistent. Receptacle campanulate, tomentellous to tomentose on exterior, tomentose within. Calyx lobes acute, puberulous on both surfaces. Petals 5, pubescent. Stamens 5-7, inserted in a complete circle; filaments shorter than calyx lobes, free to base. Ovary lanate to short-pubescent. Style rising to base of anthers, pubescent. Fruit round to oblong; epicarp smooth or less frequently markedly costate, velutinous-pubescent or glabrous.

Hymenopus hirsutus (Prance) Sothers & Prance

Has as synonym

basionym *Licania hirsuta* Prance

DESCRIPTION

Leaf: abaxial hirsute; **shape** oblong-elliptic; **petiole gland(s)** absent. **Inflorescence:** type racemose/panicle. **Flower:** stamen included; **pedicel** sessile; **receptacle** campanulate. **Fruit:** exocarp unknown; **shape** unknown.

ADDITIONAL DESCRIPTION

Shrub to 3 m tall. Branches hirsutulous, glabrescent when young, not lenticellate. Leaves with stipules linear, 4-5 mm long, coriaceous, extrapetiolar, persistent; petioles 7-8 mm long, hirsutulous, terete, eglandular; lamina oblong-elliptic, coriaceous, 12-19 × 5-8.5 cm, acuminate at apex with acumen 3-6 mm long, cuneate at base, glabrous above; venation hirsute beneath; midrib pubescent above, impressed on lower portion, plane or impressed towards apex; primary veins 9-10 pairs, impressed above, prominent beneath; secondary venation impressed above. Inflorescences of terminal and subterminal racemose panicles with rachis and branches sparsely hirsute. Bracts ovate, to 5 mm long, persistent, bracteoles minute, persistent, hirsute on exterior. Flowers c. 1.5 mm long, sessile. Receptacle campanulate, sessile, hirsute on exterior, tomentose within. Calyx lobes acute, puberulous on both surfaces. Petals 5, pubescent. Stamens 7-9, inserted around complete circle; filaments glabrous, shorter than calyx lobes, connate to mid point. Ovary villous. Fruit not seen.

DESCRIPTION

Leaf: abaxial glabrous; **shape** elliptic/oblong-elliptic; **petiole gland(s)** present. **Inflorescence:** **type** racemose/panicle. **Flower:** stamen included; pedicel sessile; receptacle campanulate. **Fruit:** exocarp velutinous; **shape** globose.

ADDITIONAL DESCRIPTION

Trees to 20 m tall. Branches puberulous or hispid when young, becoming glabrous with age. Leaves: stipules linear, to 15 mm long, persistent, axillary; petioles 4-7 mm long, terete, glabrous or sparsely puberulous, sometimes hispid when young, with 2 prominent protruding medial glands; lamina broadly elliptic to oblong-elliptic, 9-23 × 4.5-14 cm, rounded to acute at apex, rounded at base, glabrous on both surfaces; midrib plane or nearly so above, glabrous; primary veins 8-12 pairs, extremely prominent below, prominulous above. Inflorescences terminal and subterminal racemose panicles; rachis and branches tomentellous. Flowers 2-2.5 mm long, sessile along primary and secondary branches of inflorescence. Bracts and bracteoles 1-2 mm long, lanceolate, persistent, tomentellous on exterior, glabrous within. Receptacle campanulate, tomentellous on exterior, tomentose within, sessile. Calyx lobes acute, puberulous. Petals 5, pubescent. Stamens c. 5, inserted in a complete circle; filaments shorter than calyx lobes, glabrous, free to base; anthers deltoid. Ovary tomentose. Style rising to base of filaments, hirsute throughout. Fruit globose, c. 1.5 cm diameter; epicarp ferruginous-velutinous; mesocarp thin; endocarp thin, fibrous, glabrous within.

Hymenopus krukovii (Standl.) Sothers & Prance

Has as synonym

basionym *Licania krukovii* Standl.

DESCRIPTION

Leaf: abaxial hirsute; **shape** oblong/lanceate; **petiole gland(s)** present. **Inflorescence:** type racemose/panicle. **Flower:** stamen included; **pedicel** sessile; **receptacle** campanulate. **Fruit:** exocarp pubescent; **shape** subglobose.

ADDITIONAL DESCRIPTION

Tree to 25 m tall. Branches densely ferrugineous-tomentose when young, becoming lenticellate with age. Leaves with stipules axillary, to 1 cm long, broadly ovate, acute, persistent, tomentose on exterior; petioles 4-7 mm long, densely pilose-tomentose, terete, with 2 glands towards base; lamina oblong to oblong-lanceolate, chartaceous, 11-20 × 4-10 cm, acuminate at apex with acumen 3-10 mm long, rounded to subcuneate at base, glabrous or sparsely hirsute when young on upper surface, hirsute on veins and nerves beneath; palisade glands absent; midrib ferrugineous-tomentose above, plane; primary veins 13-15 pairs, plane and hirsute above, prominent beneath, arcuate towards lamina margins. Inflorescences spreading racemose panicles; rachis and branches ferrugineous-pilose-tomentose. Flowers 2-2.5 mm long, sessile and in small clusters on primary and secondary branches of inflorescence. Bracts and bracteoles oblong-lanceolate, 1.5 mm long, acute, persistent, ferrugineoustomentose on exterior. Receptacle campanulate, sessile, densely pilose-tomentose on exterior, pilose within. Calyx lobes acute, pubescent on both surfaces. Petals 5, pubescent. Stamens 5, inserted in a nearly complete circle; filaments shorter than calyx lobes, free to base, glabrous. Ovary tomentose. Style pubescent throughout. Fruit subglobose, 2.8 × 2.5 cm, exocarp brown-pubescent.

Hymenopus laevigatus (Prance) Sothers & Prance

Has as synonym

basionym *Licania laevigata* Prance

DESCRIPTION

Leaf: abaxial glabrous; **shape** oblong; **petiole gland(s)** absent. **Inflorescence:** type racemose/panicle. **Flower:** stamen included; **pedicel** pedicellate; **receptacle** urceolate. **Fruit:** exocarp tomentulose; **shape** globose.

ADDITIONAL DESCRIPTION

Trees to 20 m tall. Branches glabrous when young. Leaves: stipules axillary, caducous; petioles 5-8 mm long, with confluent leaf base, glabrous, eglandular; lamina oblong, coriaceous, 9-18 × 4.2-7 cm, cuneate at base, acuminate at apex with acumen 4-10 mm long, glabrous on both surfaces, shiny above; midrib prominulous above, prominent beneath; primary veins 7-10 pairs, prominulous on both surfaces, widely spaced with 1.2-1.8 mm between veins. Inflorescences of terminal and subterminal racemose panicles; rachis puberulous. Bracts and bracteoles minute, triangular, tomentose, subpersistent. Flowers c. 2 mm long, inserted on primary inflorescence branches. Receptacle urceolate, brown-tomentellous on exterior, tomentose within; pedicels 0.5-1 mm long. Calyx lobes 5, triangular, tomentellous on both surfaces. Petals 5, pubescent on exterior, with ciliate margins. Stamens 6 or 7, inserted around 3/4 of circle with tooth-like staminodes opposite; filaments shorter than calyx lobes, free, glabrous; anthers deltoid. Ovary tomentellous on exterior; style pubescent on lower portion. Fruit when young globose; exocarp densely short-ferrugineous tomentellous.

Hymenopus latifolius (Benth. ex Hook.f.) Sothers & Prance

Has as synonym

basionym *Licania latifolia* Benth. ex Hook.f.
heterotypic *Licania obovata* Benth. ex Hook.f.

DESCRIPTION

Leaf: abaxial hirsute; **shape** oblong-elliptic/obovate; **petiole gland(s)** present. **Inflorescence:** type racemose/panicle. **Flower:** stamen included; **pedicel** sessile; **receptacle** urceolate. **Fruit:** **exocarp** velutinous; **shape** globose.

ADDITIONAL DESCRIPTION

Shrub or tree to 25 m tall. Branches pubescent when young, soon becoming glabrous and lenticellate. Leaves with stipules axillary, 3-8 cm long, triangular, acuminate, membranous, persistent; petioles 7-15 mm long, rufous-brown tomentose, terete, usually with 2 or more medial sessile glands; lamina obovate to oblong-elliptic, thick-coriaceous, 6-20 × 4.5-10.5 cm, rounded to bluntly apiculate at apex, rounded to subcuneate at base, glabrous on upper surface, prominently reticulate beneath, with sparse hirsute pubescence on venation; palisade glands absent; midrib plane above, tomentose when young; primary veins 12-20 pairs, slightly impressed above, prominent beneath, arcuate near lamina margins. Inflorescences spreading racemose panicles; rachis and branches ferruginous-tomentose. Flowers c. 2.5 mm long, sessile, in dense glomerules on branches of inflorescence. Bracts and bracteoles to 1.5 mm long, ovate, persistent, tomentose on exterior. Receptacle urceolate, sessile, ferrugineoustomentose on exterior, tomentose within. Calyx lobes acute, tomentose on both surfaces. Petals 5, c. 1 mm long, pubescent. Stamens 6-10, inserted in a complete circle; filaments connate for 1/2 of length, shorter than calyx lobes. Ovary velutinous-tomentose. Style pilose throughout, equaling filaments. Fruit globose; epicarp rufous-velutinous; pericarp thin, hard, fibrous; sparsely pubescent within when young.

DESCRIPTION

Leaf: abaxial glabrous; **shape** oblong; **petiole gland(s)** present. **Inflorescence:** type racemose/panicle. **Flower:** stamen exserted; **pedicel** pedicellate; **receptacle** campanulate/urceolate. **Fruit:** exocarp glabrous/smooth/verrucose; **shape** ovoid/pyriform.

ADDITIONAL DESCRIPTION

Trees to 30 m tall. Branches almost glabrous when young. Leaves: stipules linear, 6-15 mm long, submembranous, axillary, persistent; petioles 6-14 mm long, glabrous, usually shallowly canaliculate, with 2 sessile glands at base of lamina; lamina narrowly oblong with parallel margins, coriaceous, 13-40 × 4.5-10.5 cm, acuminate to obtuse at apex with acumen 6-11 mm long, rounded to cordate at base, glabrous on both surfaces; palisade glands absent; midrib prominent above, glabrous; primary veins 12-16 pairs, prominent beneath, prominent above. Inflorescences axillary racemose panicles on woody stems; rachis and branches sparsely puberulous. Flowers 2.5-3 mm long, solitary or in small groups on primary and secondary branches of inflorescence. Bracts and bracteoles ovate to lanceolate, 1-3 mm long, puberulous on both surfaces, persistent, entire. Receptacle campanulate to shortly urceolate, puberulous on exterior, arachnoid within; pedicels 0.25-0.5 mm long. Calyx lobes acute, puberulous on both surfaces. Petals 5, pubescent, shortly unguiculate. Stamens 5 fertile, with 5 or 6 staminodes, inserted in a complete circle; filaments slightly exceeding calyx lobes, connate at base to form a short tube, with a dense lanate mass surrounding filaments and filling mouth of receptacle. Ovary lanate-tomentose. Style pubescent throughout, equalling filaments. Fruit ovoid to pyriform, to 8 cm diameter; epicarp smooth, glabrous or crustaceous-verrucose, drying black; mesocarp c. 8 mm thick, hard when dry; endocarp thin, granular, glabrous within.

Hymenopus miltonii (Prance) Sothers & Prance

Has as synonym

basionym *Licania miltonii* Prance

DESCRIPTION

Leaf: abaxial glabrous; **shape** oblong; **petiole gland(s)** absent. **Inflorescence:** type panicle. **Flower:** stamen unknown; **pedicel** pedicellate; **receptacle** campanulate. **Fruit:** exocarp glabrous/smooth; **shape** ellipsoid.

ADDITIONAL DESCRIPTION

Tree 5 m tall. Branches sparsely puberulous when young, soon becoming glabrous. Leaves with stipules axillary, linear, persistent, c. 2 mm long; petioles 1-3 mm long, terete, eglandular, with few sparse appressed hairs; lamina narrowly oblong, chartaceous, 4-10.2 × 1.3-3.8 cm, cuneate at base, cuspidate-acuminate at apex with acumen 6-12 mm long, glabrous on both surfaces; midrib slightly prominulous above, prominent beneath, with a few stiff appressed hairs on both surfaces; primary veins 6-8 pairs, plane above, slightly prominulous beneath. Inflorescences terminal and axillary little-branched panicles 1-3 cm long; rachis and branches very sparsely hirsutulous. Bracts and bracteoles minute, membranous, sparsely hirsutulous on exterior, persistent, entire. Flowers minute, 1-1.5 mm long, borne solitary on short primary branches of inflorescence. Receptacle campanulate, glabrous or sparsely hirsutulous on exterior, tomentose on exterior; pedicels 0.2 mm long. Calyx lobes 5, acute, glabrous, except for a few stiff appressed hairs on exterior; margins ciliate. Petals 5, tomentellous within towards apex, glabrous beneath, puberulous on outer surface. Stamens 5, fertile, inserted on short thick filaments, connate at base. Ovary sparsely hirsute. Fruit ellipsoid, c. 2 cm long, 1 cm broad; exocarp smooth, glabrous; mesocarp thin; endocarp 0.5 mm thick, glabrous within.

Hymenopus oblongifolius (Standl.) Sothers & Prance

Has as synonym

basionym *Licania oblongifolia* Standl.

DESCRIPTION

Leaf: abaxial glabrous; **shape** oblong; **petiole gland(s)** present. **Inflorescence:** type panicle. **Flower:** stamen equal; pedicel pedicellate; **receptacle** campanulate. **Fruit:** exocarp glabrous/smooth/verrucose/pulverulent; **shape** globose/ovoid.

ADDITIONAL DESCRIPTION

Tree to 30 m tall. Branches glabrous, not lenticellate when young. Leaves with stipules linear, 3-5 mm long, submembranous, axillary, persistent; petioles 5-11 mm long, glabrous, shallowly canaliculate, usually with 2 sessile glands at base of lamina; lamina oblong with parallel sides, coriaceous, 6-17 × 2.5-6 cm, rounded at apex, acute to short-acuminate, with acumen to 5 mm long, rounded to subcordate at base, glabrous on both surfaces; palisade glands occasional; midrib prominulous above, glabrous; primary veins 9-15 pairs, prominent beneath, prominulous above. Inflorescences axillary panicles; rachis and branches puberulous. Flowers 1.5-2 mm long, solitary on primary and secondary branches of inflorescence. Bracts and bracteoles 0.2-1 mm long, persistent, puberulous on exterior, entire. Receptacle campanulate, puberulous on exterior, puberulous within; pedicels 0.5-1 mm long. Calyx lobes acute, puberulous on both surfaces. Petals 5, densely lanate, usually short-unguiculate. Stamens 5 or 6 fertile, inserted in a complete circle; filaments equalling calyx lobes, slightly connate at base, with a dense lanate mass surrounding the filaments and filling the mouth of receptacle. Ovary lanate-tomentose. Style pubescent throughout, equalling filaments. Fruit globose to ovoid, to 6 cm wide, 9 cm long; epicarp glabrous, smooth, or crustaceouspulverulent; surface deeply and broadly rugose when mature; mesocarp 4-7 mm thick, fibrous, hard when dry; endocarp thin, granular, fragile, glabrous and shining within.

Hymenopus occultans (Prance) Sothers & Prance

Has as synonym

basionym *Licania occultans* Prance

DESCRIPTION

Leaf: abaxial glabrous; **shape** oblong-elliptic; **petiole gland(s)** absent. **Inflorescence:** type racemose/panicle. **Flower:** stamen included; **pedicel** pedicellate; **receptacle** campanulate. **Fruit:** exocarp unknown; **shape** unknown.

ADDITIONAL DESCRIPTION

Tree to 30 m tall. Branches glabrous when young, with large conspicuous lenticels. Leaves with stipules axillary, small, caducous; petioles 2-5 mm long, with confluent leaf base, glabrous, eglandular; lamina oblong-elliptic, chartaceous, 4.5-8 × 2.5-4 cm, cuneate at base, acuminate at apex with acumen 4-9 mm long, cuspidate, glabrous on both surfaces; midrib prominent above, prominent beneath; primary veins 5-7 pairs, prominent on both surfaces, widely spaced. Inflorescences of terminal and subterminal racemose panicles; rachis sparsely grey-puberulous. Bracts and bracteoles triangular, minute, 0.5 mm long, persistent, puberulous. Flowers c. 1.5 mm long, inserted on primary inflorescence branches. Receptacle campanulate, sparsely puberulous on exterior, tomentellous within; pedicels c. 0.5 mm long. Calyx lobes 5, triangular, puberulous on both surfaces. Petals 5, sparsely pubescent on exterior; margins ciliate. Stamens 5 or 6, inserted around 3/4 of circle; filaments shorter than calyx lobes, free, glabrous. Ovary puberulous on exterior; style villous on lower 1/2. Fruit unknown.

Hymenopus prismatocarpus (Spruce ex Hook.f.) Sothers & Prance

Has as synonym

basionym *Licania prismatocarpa* Spruce ex Hook.f.

DESCRIPTION

Leaf: abaxial glabrous; **shape** oblong-elliptic; **petiole gland(s)** absent. **Inflorescence:** type panicle. **Flower:** stamen included; **pedicel** pedicellate; **receptacle** campanulate. **Fruit:** **exocarp** glabrous/smooth; **shape** oblong.

ADDITIONAL DESCRIPTION

Tree to 25 m tall, often with stilt roots at the base. Branches hispid-tomentellous when young, glabrescent. Leaves with stipules axillary, eglandular, ovate, 1-2 mm long, persistent; petioles 3-6 mm long, terete, appressed tomentellous and hirsute, eglandular; lamina oblong-elliptic, 5-11 × 3-7 cm, retuse, rounded or shortly apiculate at apex, rounded to subcuneate at base, with few stiff appressed hairs on veins and margins, otherwise glabrous beneath, glabrous above; midrib prominent above, with few sparse appressed hairs above, sparsely pubescent beneath; primary veins 6-9 pairs, slightly impressed above when dry, prominent beneath; secondary venation conspicuously reticulate. Inflorescences terminal and subterminal axillary panicles on short peduncles; rachis and branches shortly tomentellous. Bracts and bracteoles minute, 0.5 mm long, membranous, subpersistent. Receptacle campanulate, puberulous on exterior, tomentose within. Calyx lobes acute, puberulous on both surfaces. Petals 5, pubescent on both surfaces. Stamens 5-7, inserted in a complete circle; filaments shorter than calyx-lobes, free to base. Ovary lanate-pubescent. Style arising to base of anthers, pubescent. Fruit oblong, c. 3 cm long, 2 cm broad; epicarp smooth, glabrous, markedly angled when young and slightly angled when mature and dry; mesocarp c. 1 mm thick; endocarp very thin, bony, glabrous within.

Has as synonym

basionym *Licania reticulata* Prance

DESCRIPTION

Leaf: abaxial glabrous; **shape** oblong/oblong-elliptic; **petiole gland(s)** present. **Inflorescence:** type panicle. **Flower:** stamen equal; **pedicel** pedicellate; **receptacle** campanulate. **Fruit:** exocarp glabrous/smooth; **shape** oblong.

ADDITIONAL DESCRIPTION

Trees. Branches glabrous, lenticellate when young. Leaves: stipules to 2 mm long, lanceolate, membranous, extra-petiolar, caducous; petioles 7-12 mm long, glabrous, terete, with 2 sessile glands near to lamina; lamina oblong-elliptic to oblong, coriaceous, 8-24 × 3.3-10 cm, glabrous and reticulate on both surfaces; apex acuminate with acumen 2-5 mm long; base rounded to subcuneate; midrib glabrous and plane above; primary veins 10-13 pairs, prominent on both surfaces. Flowers 2.5-3 mm long. Inflorescence of terminal panicles of cymes; rachis lenticellate; rachis and branches sparsely puberulous. Bracts and bracteoles c. 1 mm long, ovate, caducous. Receptacle campanulate, puberulous on exterior, tomentellous within; pedicels 0.25-1.5 mm long. Calyx lobes acute, puberulous on both surfaces. Petals 5, sparsely pubescent. Stamens 6 or 7, inserted around complete circle; filaments connate to mid point, pubescent, equalling calyx lobes. Ovary sparsely villous. Style lanate pubescent. Fruit oblong, to 7 cm long; exocarp smooth, glabrous, longitudinally striate; mesocarp thin, fleshy; endocarp thin, hard, glabrous within.

Hymenopus sothersiae (Prance) Sothers & Prance

Has as synonym

basionym *Licania sothersiae* Prance

DESCRIPTION

Leaf: abaxial glabrous; **shape** oblong-elliptic; **petiole gland(s)** present. **Inflorescence:** type racemose/panicle. **Flower:** stamen included; **pedicel** pedicellate; **receptacle** campanulate. **Fruit:** exocarp glabrous/lenticellate; **shape** globose.

ADDITIONAL DESCRIPTION

Tree to 20 m tall. Branches puberulous when young, glabrescent, with narrowly-oblong lenticels. Leaves with stipules lanceolate, axillary, 5-6 mm long, membranous, caducous; petioles 8-13 mm long, terete, with 2 prominent subopposite glands on middle, sparsely hirsutulous; lamina oblong-elliptic, 5.5-11 × 3-6 cm, retuse at apex, cuneate at base, glabrous above, glabrous beneath except for very few stiff appressed hairs on midrib and primary veins; midrib prominulous above, with few sparse appressed hairs on both surfaces; primary veins 6 or 7 pairs, prominulous above, prominent beneath; secondary venation conspicuously reticulate beneath. Inflorescences of terminal and subterminal panicles of racemes; flowers sessile on primary branches and not grouped into cymules; rachis and branches shortly appressed tomentellous. Bracts and bracteoles minute, 0.5-1 mm long, lanceolate, membranous, persistent. Receptacle campanulate, puberulous on exterior, tomentose within. Calyx lobes acute, puberulous on both surfaces. Petals 5, puberulous on both surfaces. Stamens 6 or 7, inserted in a complete circle; filaments shorter than calyx lobes, free to base. Ovary lanate pubescent. Style arising to base of anthers, pubescent. Fruit globose, c. 2 × 2 cm; exocarp glabrous, lenticellate.

Leptobalanus (Benth.) Sothers & Prance

This treatment is composed of the following taxa: *Leptobalanus*, *Leptobalanus apetalus*, *Leptobalanus emarginatus*, *Leptobalanus gardneri*, *Leptobalanus granvillei*, *Leptobalanus humilis*, *Leptobalanus joseramosii*, *Leptobalanus latus*, *Leptobalanus longistylus*, *Leptobalanus maguirei*, *Leptobalanus octandrus*, *Leptobalanus parvifolius*, *Leptobalanus sclerophyllus*, *Leptobalanus sprucei*, *Leptobalanus turbinatus*, *Leptobalanus wurdackii*.

HOW TO CITE

Sothers, C.A., Prance, G.T. 2020. *Leptobalanus* in **Flora do Brasil 2020**. Jardim Botânico do Rio de Janeiro. Available at: <http://floradobrasil.jbrj.gov.br/reflora/floradobrasil/FB604711>.

DESCRIPTION

Trees. Leaves: stipules persistent or caducous; lamina lower surface glabrous, tomentose or lanate, hair-filled stomatal cavities present or absent. Petiole with glands present or absent. Inflorescence a panicle, racemose panicle or panicle of cymes. Bracts and bracteoles small, eglandular or sometimes glandular (in *L. alba*, *L. longistyla*, *L. octandra* and *L. sprucei*). Flowers bisexual, sub-actinomorphic. Receptacle cupuliform to campanulate, hairy inside, but throat without long retrorse hairs. Petals absent. Stamens 7–22; filaments exserted to far-exserted, inserted in a complete circle, free or less often slightly connate at base; staminodes usually absent. Ovary 1-carpellary, 1-locular, inserted at base of receptacle tube; style filiform, indistinctly 3-lobed at apex. Fruit a drupe, 5.5 × 2–2.5 cm; epicarp smooth, lenticellate or pubescent; endocarp pubescent or rarely glabrous, without any special mechanisms for seedling escape.

COMMENTS

A genus of 31 species distributed from Mexico, Central America and the Caribbean through to northern South America, the Guianas, Peru, Ecuador, Bolivia and SE Brazil.

IDENTIFICATION KEY

- 1 Leaf lower surface glabrous or lanate, sometimes with prominent venation, stomatal cavities absent.
 - 2 Stamens exserted well beyond calyx lobes.
 - 3 Most flowers borne in small groups or cymules on secondary branches (peduncles) of inflorescence; peduncles over 2 mm long.
 - 4 Rachis of inflorescence densely yellow-villous-pubescent.....**L. wurdackii**
 - 4' Rachis of inflorescence grey puberulous or arachnoid pubescent when young.
 - 5 Inflorescence short and compact 3-5 cm long; leaf lamina ovate, apex obtuse to acute.....**L. turbinatus**
 - 5' Inflorescence longer and spreading, 6-20 cm long; leaf lamina oblong to elliptic, acuminate at apex.
 - 6 Flowers 3.5-5 mm long; petioles deeply canaliculate; lamina base with 2 prominent glands; leaf undersurface with short pulverulent pubescence. **L. latus**
 - 6' Flowers 2-3 mm long; leaf undersurface glabrous or lanate, eglandular.
 -**L. apetalus**
 - 3' Flowers borne on primary branches of inflorescence, sessile or short-pedunculate
 - 7 Leaf apex predominantly obtuse to acute.
 - 8 Rachis of inflorescence densely yellow-villous-pubescent.....**L. wurdackii**
 - 8' Rachis of inflorescence grey-puberulous.....**L. parvifolius**
 - 7' Leaf apex acuminate.
 - 9 Receptacle cupuliform; petiole with 2 glands; stamens 14.....**L. maguirei**
 - 9' Receptacle campanulate; petiole eglandular; stamens 9-12.
 - 10 Flowers 3.5-5 mm long; leaves with short waxy lanate pubescence beneath.
 -**L. latus**
 - 10' Flowers 2-3.5 mm long; leaves glabrous or dense lanate beneath.
 - 11 Stipules; persistent on young branches; leaf base rounded to subcordate; upper portion of ovary glabrous.**L. gardneri**
 - 11' Stipules caducous; leaf base usually cuneate.
 - 12 Inflorescence and flower exterior sparsely puberulous; leaves thickly coriaceous; the apex finely acuminate with acumen 10-15 mm long; petioles canaliculate.....**L. granvillei**
 - 12' Inflorescence and flower exterior densely grey-puberulous; leaves chartaceous; the apex acuminate, with acumen 3-15 mm long; petioles terete.....**L. apetalus**
 - 2' Stamens equalling or scarcely exceeding calyx lobes.
 - 13 Stamens c. 19; leaves 15-20 cm long; flowers 5 mm long.....**L. joseramosii**
 - 13' Stamens 10-11; leaves 3-8.5 mm long; flowers 2-3 mm long.....**L. emarginatus**
 - 1' Leaf lower surface with stomatal cavities filled at the mouth with lanate pubescence.
 - 14 Inflorescence with secondary branches, flowers borne on distinct secondary branches at least 2 mm long.
 - 15 Flowers in distinct small, pedicellate groups (cymules); leaf upper surface smooth; the base rounded to cuneate.....**L. sprucei**
 - 15' Flowers more or less clustered in small sessile groups on primary and secondary branches of inflorescence; leaf upper surface papillose; the base rounded to cordate.
 -**L. sclerophyllum**
 - 14' Inflorescence with primary branches only; flowers sessile or with short pedicels 0.5 mm
 - 16 Flowers with pedicels 0.5-1.5 mm long; leaf reticulation extremely prominent on upper surface; fruit exterior appressed-yellow-velutinous.....**L. longistylus**
 - 16' Flowers sessile; leaf reticulation prominulous on upper surface; fruit exterior glabrous or brown-tomentose.
 - 17 Young branches densely tomentellous, trunk with a thick corky bark.....**L. humilis**
 - 17' Young branches almost glabrous; trunk with thin bark.....**L. octandrus**

Leptobalanus apetalus (E.Mey.) Sothers & Prance

This treatment is composed of the following taxa: *Leptobalanus apetalus*, *Leptobalanus apetalus* var. *apertus*, *Leptobalanus apetalus* var. *apetalus*.

Has as synonym

basionym *Hirtella apetala* E.Mey.
homotype *Licania apetala* (E.Mey.) Fritsch

DESCRIPTION

Leaf: abaxial glabrous/lanate; **petiole gland(s)** absent. **Inflorescence:** type panicle/racemose. **Flower:** stamen number 10; filament length exserted; **pedicel** pedicellate/sessile; **receptacle** campanulate. **Fruit:** exocarp glabrous/smooth.

ADDITIONAL DESCRIPTION

Tree to 40 m tall. Branches glabrous or sparsely puberulous when young, becoming glabrous, not lenticellate. Leaves with stipules linear to 4 mm long, membranous, rarely persistent; petioles 3-6 mm long, glabrous or sparsely pubescent when young, eglandular, terete; lamina oblong-ovate, elliptic, or oblong-lanceolate, coriaceous, 3.7-14 × 1.3-6 cm, usually with well developed apical acumen 3-18 mm long, rarely obtuse to rounded, rounded to subcuneate at base, glabrous on upper surface, glabrous or less often with persistent or caducous lanate pubescence on lower surface; midrib prominulous above, glabrous or sparsely pubescent when young; primary veins 7-12 pairs, prominent on lower surface, prominulous above. Inflorescences racemose panicles; rachis and branches grey-puberulous. Flowers 2-3 mm long, in small groups of cymules on short secondary branches (peduncles) of inflorescence or sessile on primary branches of inflorescence. Bracts and bracteoles 0.2-1 mm long, ovate to lanceolate, persistent. Receptacle campanulate, short-puberulous to tomentose on exterior, tomentose within, sessile or with short pedicels to 5 mm long. Calyx lobes acute, puberulous to tomentose on exterior, puberulous to glabrous within. Petals absent. Stamens c. 10, inserted in a complete circle; filaments far exceeding calyx lobes, free almost to base. Ovary villous. Style villous at base only, glabrous above, equalling filaments. Fruit globose to narrowly lanceolate-fusiform; epicarp smooth, glabrous; mesocarp very thin, fleshy; endocarp thin, fragile, fibrous, sparsely pubescent within.

DISTRIBUTION

Native, Not endemic to Brazil

Phytogeographic Domains

Amazon Rainforest, Central Brazilian Savanna, Atlantic Rainforest

Vegetation Types

Caatinga (stricto sensu), Flooded Field (Várzea), Cerrado (lato sensu), Riverine Forest and/or Gallery Forest, Inundated Forest (Igapó), Ombrophylous Forest (Tropical Rain Forest), Coastal Forest (Restinga), Amazonian Savanna

Geographic Distribution

Confirmed occurrences

North (Acre, Amazonas, Amapá, Pará, Rondônia, Roraima, Tocantins)

Northeast (Bahia, Ceará, Maranhão, Piauí, Sergipe)

Central-west (Distrito Federal, Goiás, Mato Grosso)

Southeast (Rio de Janeiro)

Possible occurrences

Southeast (Rio de Janeiro)

IDENTIFICATION KEY

Flowers borne in small groups of cymules on distinct secondary branches of

inflorescence, more than 2 mm long; fruit usually elongate-lanceolate.....var. *apetalus*

Flowers predominantly sessile on primary branches of inflorescence; fruit globose.....var. *apertus*

Leptobalanus emarginatus (Spruce ex Hook.) Sothers & Prance

Has as synonym

basionym *Licania emarginata* Spruce ex Hook.f.

heterotypic *Licania petrensis* Prance

DESCRIPTION

Leaf: abaxial glabrous; **petiole gland(s)** present. **Inflorescence:** type panicle. **Flower:** stamen number 10 - 11; **filament length** included; **pedicel** subsessile; **receptacle** campanulate. **Fruit:** exocarp glabrous/smooth.

ADDITIONAL DESCRIPTION

Trees, medium to large-sized. Branches glabrous when young, not conspicuously lenticellate. Leaves: stipules minute, ovate, caducous, axillary; petioles 2-5 mm long, sparsely lanate when young, soon becoming glabrous, deeply canaliculate, with 2 sessile glands at junction with lower surface of lamina; lamina ovate-elliptic to elliptic, coriaceous, 3-8.5 × 1.5-5 cm, rounded or obtuse to bluntly acuminate at apex with acumen 0-6 mm long, rounded at base, glabrous and shiny on both surfaces; palisade glands absent; midrib glabrous and prominent above; primary veins 7-11 pairs, prominent beneath, prominulous above. Inflorescences panicles; rachis and branches puberulous. Flowers 2-3 mm long, in small cymules on distinct secondary branches of inflorescence which are 3-10 mm long. Bracts and bracteoles 0.5-1.5 mm long, ovate, caducous, entire. Receptacle campanulate, puberulous to grey-tomentose on exterior, rather sparsely tomentose within; pedicels c. 0.5 mm long. Calyx lobes acute, puberulous on both surfaces. Petals absent. Stamens 10 or 11, inserted in a complete circle; filaments shorter than calyx lobes, glabrous, free to base. Ovary pilose. Style pilose at base, glabrous above, equaling filaments. Fruit globose, c. 2 cm diam.; exocarp smooth, glabrous; mesocarp fleshy 0.5 mm thick when dry; endocarp hard, bony, c. 0.5 mm thick.

Leptobalanus gardneri (Hook.f.) Sothers & Prance

Has as synonym

basionym *Moquilea gardneri* Hook.f.
 homotype *Licania gardneri* (Hook.f.) Fritsch
 homotype *Licania mattogrossensis* Pilg.
 heterotypic *Moquilea mattogrossensis* (Pilg.) Malme

DESCRIPTION

Leaf: abaxial glabrous; **petiole gland(s)** absent. **Inflorescence:** type panicle/racemose. **Flower:** stamen number 12; **filament length** exserted; **pedicel** sessile; **receptacle** campanulate. **Fruit:** exocarp glabrous/smooth.

ADDITIONAL DESCRIPTION

Shrubs or small trees. Branches puberulous when young, soon becoming glabrous, not lenticellate. Leaves: stipules linear, membranous, 4-5 mm long, subpersistent; petioles 4-7 mm long, densely tomentose when young, terete, eglandular; lamina elliptic to oblong, coriaceous, 9-16.5 × 5-8.5 cm, acuminate at apex with acumen 5-12 mm long, rounded to subcordate at base, glabrous on both surfaces; palisade glands occasional on lower surface; midrib prominulous above, glabrous when mature, sparsely pubescent towards base when young; primary veins 11-14 pairs, prominent on both surfaces. Inflorescences terminal and subterminal racemose panicles; rachis and branches sparsely grey-puberulous. Flowers 2.5-3.5 mm long, sessile or on short pedicels not exceeding 1.5 mm long. Bracts and bracteoles 1-2.5 mm long, ovate, puberulous on exterior, entire, eglandular. Receptacle campanulate, sessile, grey-puberulous on exterior, tomentose within. Calyx lobes acute, tomentose on both surfaces. Petals absent. Stamens c. 12, inserted in a complete circle; filaments far exceeding calyx lobes, slightly connate at base, glabrous. Ovary villous at base, glabrous above. Style sparsely hirsute on lower 1/2, equalling filaments. Fruits (immature) globose, exterior smooth, glabrous.

Leptobalanus granvillei (Prance) Sothers & Prance

Has as synonym

basionym *Licania granvillei* Prance

DESCRIPTION

Leaf: abaxial glabrous; **petiole gland(s)** absent. **Inflorescence:** type panicle/racemose. **Flower:** stamen number 12; **filament length** exserted; **pedicel** sessile; **receptacle** campanulate. **Fruit:** **exocarp** glabrous/lenticellate.

ADDITIONAL DESCRIPTION

Tree to 30 m tall. Branches sparsely puberulous when young, soon becoming glabrous. Leaves with stipules caducous (not seen); petioles 5-8 mm long, canaliculate above, glabrous, eglandular, rugulose; lamina oblong, thickly coriaceous, 6-13 × 2.3-6 cm, cuneate to subcuneate at base, finely acuminate at apex with acumen 10-25 mm long, glabrous on both surfaces, without stomatal cavities; midrib prominent on both surfaces, glabrous; primary veins 12-16 pairs, prominulous on both surfaces, glabrous. Inflorescences of racemose panicles 6-12 cm long; rachis and branches sparsely appressed pubescent, appearing dark because pubescence is incomplete. Bracts and bracteoles minute, 0.25 mm long, membranous. Flowers 2-3 mm long, sessile along primary branches of inflorescence. Receptacle campanulate, sparsely puberulous to glabrous on exterior, densely tomentose within, sessile. Calyx lobes 5, acute, puberulous on both surfaces, with tomentellous margins. Petals absent. Stamens 12, inserted around complete circle; filaments exserted beyond calyx lobes, glabrous, but densely tomentose around base, free to base. Ovary sparsely lanate. Style exserted, sparsely tomentose for 1/2 of length. Fruit globose to ellipsoid, 5.5 cm long × 2.5-4 cm broad, glabrous and lenticellate on exterior; mesocarp fleshy, 3-4 mm thick; endocarp hard, bony, 1 mm thick, glabrous within.

DESCRIPTION

Leaf: abaxial stomatal-cavity; **petiole gland(s)** absent. **Inflorescence:** type paniculate. **Flower:** stamen number 9 - 12; **filament length** exserted; **pedicel** sessile; **receptacle** campanulate. **Fruit:** exocarp glabrous/smooth.

ADDITIONAL DESCRIPTION

Shrubs or low trees to 6 m tall. Stems densely tomentellous when young, with thick corky bark. Leaves: stipules linear, to 4 mm long, tomentose, caducous; petioles 2-6 mm long, densely tomentose, terete, eglandular; lamina ovate-elliptic to oblong, thick-coriaceous, 4-10.5 × 2.5-6.5 cm, rounded, obtuse, or bluntly acuminate at apex with acumen 0-8 mm long, rounded to subcuneate at base, glabrous and shining on upper surface; stomatal cavities on lower surface, with rounded veins describing open cavities filled with lanate pubescence; midrib prominent above, lanate when young; primary veins 7-10 pairs, prominent below. Inflorescences paniculate; rachis and branches brown-tomentose. Flowers c. 3 mm long, in sessile clusters on primary branches of inflorescence. Bracts and bracteoles ovate to lanceolate, 1-2 mm long, persistent, entire or with 1 or 2 small teeth on each side. Receptacle campanulate, sessile, tomentose on exterior, villous-tomentose within. Calyx lobes acute, tomentose on exterior, tomentose to puberulous within. Petals absent. Stamens 9-12, inserted in a complete circle; filaments far exceeding calyx lobes, free to base, glabrous. Ovary villous. Style pilose for most of length, equalling filaments. Fruit ovoid, 2-2.5 cm long, 1.3-2 cm broad; epicarp smooth, glabrous, drying black; mesocarp thick, fleshy; endocarp thin, fragile, sparsely hirsute within.

Leptobalanus joseramosii (Prance) Sothers & Prance

Has as synonym

basionym *Licania joseramosii* Prance

DESCRIPTION

Leaf: abaxial glabrous; **petiole gland(s)** present. **Inflorescence:** type panicle. **Flower:** stamen number 19; **filament length** exserted; **pedicel** unknown; **receptacle** campanulate. **Fruit:** **exocarp** unknown.

ADDITIONAL DESCRIPTION

Trees to 5 m tall. Branches glabrous when young. Leaves: stipules linear, c. 6 mm long, hispidulous, caducous; petioles 4-5 mm long, rugulose tomentellous when young, terete, with 2 glands near junction with lamina; lamina oblong to oblong-lanceolate, coriaceous, 13-20 × 4-6.5 cm, cuneate at base, finely acuminate at apex with acumen 15-20 mm long, glabrous on both surfaces, without stomatal cavities; primary veins 9-14 pairs, prominulous on both surfaces; midrib prominent on both surfaces. Inflorescences of panicles with long thick central rachis and short thin lateral branches bearing 1-3 flowers; rachis and branches tomentellous. Bracts and bracteoles lanceolate, subsessile, tomentellous on exterior, glabrous within, entire, with long thin acumen, eglandular. Flowers c. 5 mm long. Receptacle campanulate, grey-tomentose on exterior, tomentose within. Calyx lobes 5, acute, tomentose on exterior. Petals absent. Stamens c. 19, inserted around complete circle; filaments slightly exceeding calyx lobes, free almost to base, glabrous except for pilose annular ring. Ovary lanate. Style glabrous, equalling filaments in length. Fruit unknown.

Leptobalanus latus (J.F.Macbr.) Sothers & Prance

Has as synonym

basionym *Licania lata* J.F.Macbr.

DESCRIPTION

Leaf: abaxial lanate pulverulent; **petiole gland(s)** absent. **Inflorescence:** type panicle/racemose. **Flower:** stamen number 14; filament length exserted; **pedicel** sessile; **receptacle** campanulate/cupuliform. **Fruit:** **exocarp** glabrous/smooth.

ADDITIONAL DESCRIPTION

Trees to 20 m tall. Branches villous when young, becoming glabrous with age, not lenticellate. Leaves: stipules caducous; petioles 6-10 mm long, puberulous, becoming glabrous, terete or shallowly canaliculate, eglandular; lamina oblong-elliptic, coriaceous, 9-21 × 3-8.5 cm, acuminate at apex with acumen 7-20 mm long, rounded to subcuneate at base, glabrous above, with persistent lanate-pulverulent pubescence beneath, becoming sparse with age; palisade glands rare; 2 large sessile glands at junction of lamina and petiole on lower surface; midrib prominent above, glabrous; primary veins 10-12 pairs, prominent on both surfaces. Inflorescences terminal and axillary racemose panicles; rachis and branches brownpuberulous, sometimes arachnoid when young. Flowers 4-5 mm long, sessile on primary branches of inflorescence or on short peduncles in small groups. Bracts and bracteoles 1-4 mm long, ovate, persistent, puberulous on exterior; margins entire or serrulate. Receptacle campanulate-cupuliform, sessile, tomentose on exterior, densely villous within. Calyx lobes acute, tomentellous on exterior, puberulous within. Petals absent. Stamens c. 14, inserted in a complete circle; filaments far exceeding calyx lobes, free to base, glabrous. Ovary densely pilose. Style villous almost to apex, equalling filaments. Fruit globose, 2-3 cm in diameter; epicarp smooth, glabrous, drying black; mesocarp very thin, fleshy; endocarp very thin, 0.5 mm thick, hard, sparsely hirsute within.

Has as synonym

basionym *Moquilea longistyla* Hook.f.
homotype *Licania longistyla* (Hook.f.) Fritsch

DESCRIPTION

Leaf: abaxial stomatal-cavity; **petiole gland(s)** absent. **Inflorescence:** type panicle/racemose. **Flower:** stamen number 10; filament length exserted; **pedicel** pedicellate; **receptacle** campanulate. **Fruit:** exocarp pubescent.

ADDITIONAL DESCRIPTION

Trees to 20 m tall. Branches puberulous when young, soon becoming glabrous. Leaves: stipules linear, 3-8 mm long, membranous, axillary, subpersistent; petioles 5-13 mm long, terete, eglandular, densely pubescent, becoming glabrescent with age; lamina elliptic, coriaceous, 6-23 × 3.5-10 cm, acuminate at apex with acumen 3-12 mm long, rounded to subcuneate at base, glabrous on upper surface, rarely papillose; lower surface bearing well developed stomatal cavities with flattened venation leaving small slit-like lanate-pubescent apertures; midrib prominent above, pubescent towards base, becoming glabrous with age; primary veins 9-12 pairs, prominent below. Inflorescences terminal and axillary racemose panicles; rachis and branches grey-tomentellous. Flowers c. 3 mm long, solitary on primary branches of inflorescence. Bracts and bracteoles 2-5 mm long, ovate to lanceolate, serrulate, usually with stipitate glands. Receptacle campanulate, grey-tomentose on exterior, densely villous-tomentose within; pedicels 0.5-1.5 mm long. Calyx lobes acute, tomentose on exterior, puberulous within. Petals absent. Stamens c. 10, inserted in a complete circle; filaments far exceeding calyx lobes, free to base, glabrous. Ovary villous. Style villous on lower portion, equalling or exceeding filaments. Fruit globose, 2.5-3.5 mm in diameter; epicarp with appressed sordid yellow-velutinous pubescence; pericarp undifferentiated, thin, fragile, fibrous, sparsely villous within.

Has as synonym

basionym *Licania maguirei* Prance

DESCRIPTION

Leaf: abaxial glabrous; **petiole gland(s)** present. **Inflorescence:** type panicle. **Flower:** stamen number 14; **filament length** exserted; **pedicel** sessile; **receptacle** cupuliform. **Fruit:** exocarp unknown.

ADDITIONAL DESCRIPTION

Shrubs. Branches puberulous when young, glabrescent, not lenticellate. Leaves: stipules linear, caducous; petioles 3-7 mm long, hirsutulous when young, terete, with 2 glands beneath at junction with lamina; lamina oblong-ovate, coriaceous, 6.5-17 × 2.4-6.5 cm, acuminate at apex with acumen 7-17 mm long, rounded to subcordate at base, glabrous on both surfaces; midrib prominent and glabrous above; primary veins 10-12 pairs, plane above, prominent beneath. Inflorescences of terminal and subterminal much-branched panicles; rachis and branches densely grey-tomentose. Primary bracts to 7 mm long, caducous. Secondary bracts and bracteoles 1.5-3 mm long, ovate, persistent, tomentose on exterior; margins serrate. Flowers c. 4 mm long. Receptacle cupuliform, sessile, tomentose on exterior, villous-tomentose within. Calyx lobes acute, tomentose on both surfaces. Petals absent. Stamens c. 14, inserted around complete circle; filaments glabrous, exserted, free to base. Ovary densely villous. Style villous on lower portion. Fruit unknown.

Leptobalanus octandrus (Hoffmanns. ex Roem. & Schult.) Sothers & Prance

This treatment is composed of the following taxa: *Leptobalanus octandrus*, *Leptobalanus octandrus* subsp. *grandifolius*, *Leptobalanus octandrus* subsp. *octandrus*, *Leptobalanus octandrus* subsp. *pallidus*.

Has as synonym

basionym *Hirtella octandra* Hoffmanns. ex Schult.
homotype *Licania octandra* (Hoffmanns. ex Roem. & Schult.) Kuntze
homotype *Moquilea turiuva* (Cham. & Schldl.) Hook.f.
Licania turiuva Cham. & Schldl.

DESCRIPTION

Leaf: abaxial stomatal-cavity; **petiole gland(s)** absent. **Inflorescence:** type panicle/racemose. **Flower:** stamen number 8 - 12; filament length exserted; **pedicel** subsessile/sessile; **receptacle** campanulate. **Fruit:** exocarp glabrous/pubescent.

ADDITIONAL DESCRIPTION

Trees, small to medium-sized. Branches glabrous when young. Leaves: stipules linear, to 5 mm long, membranous, hirsutulous, subpersistent, on young branches only; petioles tomentose, becoming less so with age, terete or rarely shallowly canaliculate; glands 2, sessile, at or near junction with lower surface of lamina, often obscured by pubescence; lamina broadly ovate to oblong-lanceolate, 3-12 × 2-4 cm, obtuse to acuminate at apex with acumen 1-13 mm long, rounded to subcuneate at base, glabrous and shining above, with well developed stomatal cavities beneath; venation flattened around small slit-like apertures to the cavities, with mouth of the cavities glabrous to lanate; midrib prominent above, glabrous; primary veins 8-13 pairs, prominent on lower surface, plane or nearly so above.

Inflorescence racemose panicles; rachis and branches sparsely grey-brown-tomentose or arachnoid-pubescent. Flowers 2-3 mm long, sessile or nearly so on primary branches of inflorescence, solitary or in small groups. Bracts and bracteoles 1-4 mm long, persistent, tomentose on exterior, often serrate, with stipitate glands. Calyx lobes acute, tomentose on both surfaces. Receptacle campanulate, sessile or with short pedicels to 0.2 mm long, tomentose on exterior, densely villous within. Petals absent. Stamens 8-12, inserted in a complete circle; filaments far exceeding calyx lobes, free to base, glabrous. Ovary inserted at base of receptacle, villous. Style villous at base only with upper portion glabrous, equalling filaments. Fruit globose to elongate-lanceolate, to 2.5 cm long; epicarp glabrous or with light brown appressed pubescence; mesocarp thin and fleshy; endocarp hard, thin, fibrous, glabrous or sparsely hirsute within when young.

Life Form

DESCRIPTION

Leaf: abaxial glabrous/lanate pulverulent; **petiole gland(s)** absent. **Inflorescence:** type panicle/racemose. **Flower:** stamen number 9 - 10; **filament length** exserted; **pedicel** sessile; **receptacle** campanulate. **Fruit:** **exocarp** glabrous/smooth.

ADDITIONAL DESCRIPTION

Trees, small to medium-sized. Branches puberulous when young, soon becoming glabrous, not lenticellate. Leaves: stipules linear, to 4 mm long, membranous, persistent; petioles 3-4 mm long, hirsute when young, becoming glabrous, shallowly canaliculate to terete, eglandular; lamina ovate-elliptic to oblong, coriaceous, $3.3\text{-}8.5 \times 1.3\text{-}3.5$ cm, obtuse to acute at apex, cuneate to cordate at base, glabrous above, caducous-lanate beneath; midrib prominulous above, glabrous; primary veins 8-11 pairs, prominulous on both surfaces. Inflorescences spreading racemose panicles; rachis and branches grey-puberulous. Flowers 3 mm long, in small cymules on short secondary branches of inflorescence or sessile on primary branches. Bracts and bracteoles 0.5-1 mm long, ovate, pubescent on exterior, entire, persistent, eglandular. Receptacle campanulate, sessile, tomentose to villous-tomentose on exterior, tomentose within. Calyx lobes acute, tomentose on both surfaces. Petals absent. Stamens 9 or 10, inserted in a complete circle; filaments far exceeding calyx lobes, glabrous, free almost to base. Ovary inserted at base of receptacle, pilose. Style pilose on lower portion only, equalling or exceeding filaments. Fruit (immature) ovoid to ellipsoid, c. $1\text{-}1.5 \times 0.4\text{-}0.5$ cm; exocarp smooth, glabrescent.

DESCRIPTION

Leaf: abaxial stomatal-cavity; **petiole gland(s)** absent. **Inflorescence:** type paniculate. **Flower:** stamen number 10; **filament length** exserted; **pedicel** pedicellate; **receptacle** campanulate. **Fruit:** exocarp pubescent.

ADDITIONAL DESCRIPTION

Trees to 15 m tall. Branches pubescent when young, becoming glabrous with age. Leaves: stipules linear 3-7 mm long, membranous, axillary, subpersistent; petioles 6-10 mm long, terete, eglandular, densely tomentose; lamina elliptic to ovate-elliptic, coriaceous, 9-23 × 4-10.5 cm, acute to acuminate at apex with acumen 0-8 mm long, rounded to cordate at base; upper surface glabrous and papillose; lower surface bearing well developed stomatal cavities with flattened venation leaving small slit-like lanate-pubescent apertures; midrib prominent above, lower portion densely tomentose; primary veins 8-10 pairs, prominent beneath. Inflorescences paniculate; rachis and branches densely brown tomentose. Flowers 2-3 mm long, borne in clusters on short secondary branches of inflorescence, and on primary branches. Bracts and bracteoles 1-3 mm long, lanceolate to ovate, usually entire, rarely slightly serrate. Receptacle campanulate, tomentose on exterior, villous-tomentose within; pedicels 0.5-1.5 mm long. Calyx lobes acute, tomentose on exterior, puberulous within. Petals absent. Stamens c. 10, inserted in a complete circle; filaments far exceeding calyx lobes, free to base, glabrous. Ovary densely villous. Style villous on lower portion, equalling or exceeding filaments. Fruit globose, to 3 cm diameter; epicarp densely appressedpubescent; pericarp undifferentiated, thin, fragile, sparsely villous-pubescent within.

DESCRIPTION

Leaf: abaxial stomatal-cavity; **petiole gland(s)** present. **Inflorescence:** type panicle. **Flower:** stamen number 10; filament length exserted; **pedicel** subsessile; **receptacle** campanulate. **Fruit:** exocarp glabrous/smooth.

ADDITIONAL DESCRIPTION

Trees to 20 m tall. Branches glabrous or puberulous when young. Leaves: stipules caducous (not seen); petioles 6-10 mm long, sparsely puberulous, becoming glabrous, terete to shallowly canaliculate, rugose, with 2 glands on upper surface at base of lamina; lamina oblong to oblong-elliptic, thick-coriaceous, 6-20 × 2.5-6.5 cm, acuminate at apex with acumen 4-15 mm long, rounded to subcuneate at base; upper surface glabrous; lower surface with well developed stomatal cavities; venation plane, with slit-like apertures to cavities filled with lanate pubescence; midrib prominent above, glabrous; primary veins 9-11 pairs, prominent below. Inflorescences terminal and axillary panicles; rachis and branches sparsely puberulous. Flowers c. 3 mm long, in small cymules on short secondary inflorescence branches 2-5 mm long. Bracts and bracteoles c. 1 mm long, ovate, persistent, serrate, often with stipitate glands. Receptacle campanulate, puberulous on exterior, villous-tomentose within; pedicels c. 0.5 mm long. Calyx lobes acute, puberulous on both surfaces. Petals absent. Stamens 10, inserted in a complete circle; filaments exceeding calyx lobes, free almost to base, glabrous. Ovary villous. Style villous for most of length, equalling filaments. Fruit globose; exterior smooth, glabrous, drying black; mesocarp thin, fleshy; endocarp thin, fibrous, puberulous within.

Has as synonym

basionym *Moquilea turbinata* (Benth.) Hook.f.

homotype *Licania turbinata* Benth.

DESCRIPTION

Leaf: abaxial glabrous; **petiole gland(s)** absent. **Inflorescence:** type panicle. **Flower:** stamen number 11 - 12; **filament length** exserted; **pedicel** pedicellate/subsessile; **receptacle** campanulate. **Fruit:** exocarp glabrous/smooth.

ADDITIONAL DESCRIPTION

Trees to 15 m or shrub. Branches glabrous when young, not lenticellate. Leaves: stipules caducous; petioles 3-6 mm long, sparsely pubescent when young, soon glabrescent, eglandular, shallowly canaliculate; lamina ovate, 3-11 × 2-6 cm, coriaceous, obtuse to bluntly acuminate at apex with acumen 0-4 mm long, rounded at base, glabrous on both surfaces; palisade glands absent; midrib prominulous above, glabrous; primary veins 8-11 pairs, prominulous on both surfaces. Inflorescences short terminal panicles to 11 cm long; primary branches short, 0.5-1.8 cm long; rachis and branches sparsely grey-puberulous. Flowers 4 mm long, in small cymules on short secondary branches of inflorescence. Bracts and bracteoles 0.5-1 mm long, ovate, eglandular, subpersistent; margins entire or serrulate. Receptacle broadly campanulate, grey-puberulous on exterior, villous within; pedicels c. 0.5 mm long. Calyx lobes acute, puberulous on both surfaces. Petals absent. Stamens 11 or 12, inserted in a complete circle; filaments exceeding calyx lobes, free almost to base, glabrous. Ovary villous at base, glabrous above. Style hirsute on lower portion only, equalling filaments. Fruit when young globose; epicarp smooth, glabrous, drying black; mesocarp thin; endocarp hard, thin, with interior hirsute.

Leptobalanus wurdackii (Prance) Sothers & Prance

Has as synonym

basionym *Licania wurdackii* Prance

DESCRIPTION

Leaf: abaxial glabrous; **petiole gland(s)** present. **Inflorescence:** type panicle. **Flower:** stamen number 8 - 10; **filament length** exserted; **pedicel** sessile; **receptacle** campanulate. **Fruit:** **exocarp** glabrous/smooth/verrucose.

ADDITIONAL DESCRIPTION

Trees, small. Branches lanate-arachnoid pubescent when young, soon becoming glabrous, not lenticellate. Leaves: stipules linear, membranous, 3-4 mm long, subpersistent; petioles 5-9 mm long, densely tomentose, glandular, lightly canaliculate or terete; lamina oblong to oblong-ovate, coriaceous, 5.5-10 × 2.2-5.3 cm, sparsely lanate-pubescent on both surfaces when young, soon becoming glabrous; apex obtuse; base rounded to subcuneate; midrib prominulous above; primary veins 7-10 pairs, prominent beneath, plane above. Flowers c. 4 mm long. Inflorescence terminal and subterminal panicles of cymes; rachis and branches densely yellow-brown pilose-tomentose. Primary bracts lanceolate to 12 mm long, caducous; other bracts and bracteoles lanceolate to ovate, eglandular, to 3 mm long, persistent, tomentose on exterior, glabrous within. Receptacle campanulate, sessile, tomentose on exterior, villous-tomentose within. Calyx lobes acute, pubescent on both surfaces. Petals absent. Stamens 8-10, inserted around complete circle; filaments far exserted, glabrous, free to base. Ovary densely villous-pubescent on basal portion. Style villous on basal part, glabrous above. Fruit lanceolate-fusiform; exocarp smooth, glabrous, sparsely verrucose; mesocarp thin; endocarp thin, fragile, sparsely hirsute within.

DESCRIPTION

Trees to 35 m, shrubs, or rarely a rhizomatous geoxyllic suffrutex. Leaves: stipules caducous or persistent, often adnate to petiole base; lamina often with an ill-defined glandular area on upper surface at junction of lamina and the eglandular petiole or with distinct petiolar glands; lower surface glabrous, lanate, tomentose, strigose, pulverulent-farinaceous, pulverulent-furfuraceous or with hair-filled stomatal cavities. Inflorescence a simple or branched raceme of sessile or subsessile cymose glomerules, more rarely a simple or branched raceme of shortly stalked cymose glomerules, rarely a raceme or spike, or a raceme of many-flowered lax cymes. Bracts and bracteoles usually eglandular and not enclosing the flower-buds (except in *L. densiflora*). Flowers bisexual, sub-actinomorphic. Receptacle cupuliform, conical, globose, campanulate or urceolate, hairy inside, but throat without long retrorse hairs. Sepals 5, subequal, acute. Petals absent. Stamens 2-11; filaments inserted in a complete circle, $\frac{3}{4}$ of a circle or unilateral, included and usually shorter than or rarely equalling calyx, free or connate at base; staminodes usually absent. Ovary 1-carpellary, 1-locular, inserted at base of receptacle tube; style filiform, indistinctly 3-lobed at apex. Fruit a dry or fleshy drupe; epicarp tomentose, glabrous or verrucose, pubescent, pulverulent, or smooth; endocarp glabrous or variously pilose within; thick, hard and woody, or thin and fibrous, without any special mechanisms for seedling escape.

COMMENTS

A genus of ca. 100 species, distributed from Mexico throughout Central and South America to southeastern Brazil, and in the Leeward Islands.

Life Form

Shrub, Subshrub, Tree

Substrate

Terrestrial

DISTRIBUTION

Native, Not endemic to Brazil

Phytogeographic Domains

Amazon Rainforest, Caatinga, Central Brazilian Savanna, Atlantic Rainforest

Vegetation Types

Amazonian Campinarana, Cerrado (lato sensu), Riverine Forest and/or Gallery Forest, Inundated Forest (Igapó), Terra Firme Forest, Inundated Forest (Várzea), Seasonally Semideciduous Forest, Ombrophylous Forest (Tropical Rain Forest), Mixed Ombrophylous Forest, Coastal Forest (Restinga), Amazonian Savanna

Geographic DistributionConfirmed occurrences

North (Acre, Amazonas, Amapá, Pará, Rondônia, Roraima, Tocantins)

Northeast (Alagoas, Bahia, Maranhão, Paraíba, Pernambuco, Piauí, Sergipe)

Central-west (Distrito Federal, Goiás, Mato Grosso do Sul, Mato Grosso)

Southeast (Espírito Santo, Minas Gerais, Rio de Janeiro, São Paulo)

Possible occurrences

North (Acre)

IDENTIFICATION KEY

1. Leaf undersurface entirely glabrous.
 2. Receptacle urceolate; leaves membranous, base cuneate..... **L. glazioviana**
 2. Receptacle campanulate; leaves coriaceous, base rounded to cordate (except *L. marleneae*)
 3. Leaf apex rounded to obtuse; stamens 4-5.
 4. Stipules axillary, caducous; leaf base rounded; petioles 3-5 mm..... **L. irwinii**
 4. Stipules adnate to petiole base; leaf base cordate or cuneate; petioles 2-3 mm.
 5. Leaf base cuneate..... **L. marleneae**
 5. Leaf base cordate to rounded..... **L. littoralis**
 3. Leaf apex distinctly acuminate; stamens 3 or 6-7.
 6. Stamens 3; stipules axillary, caducous; petioles 2-4 mm long; with 2 glands. **L. silvae**
 6. Stamens 6-7; stipules adnate to petiole base; petioles 6-14 mm long; without glands.
 - **L. polita**
 1. Leaf undersurface pubescent or with hair-filled stomatal cavities.
 7. Leaf undersurface with a pulverulent farinaceous pubescence.
 8. Flowers borne in cymules on long slender secondary branches attached to the primary inflorescence branches.
 9. Leaf apex rounded; receptacle urceolate; stamens 5-6..... **L. cymosa**
 9. Leaf apex acuminate; receptacle campanulate; stamens 3-5.
 10. Exterior of flowers and branches of inflorescence glabrous..... **L. parvifructa**
 10. Exterior of flowers and inflorescence branches puberulous
 11. Inflorescence branches sparse puberulous; midrib and veins plane or prominulous on upper surface; leaves 2.5-10 cm long..... **L. hypoleuca**
 11. Inflorescence branches glabrous; midrib and veins prominent on upper surface; leaves 6.5-16 cm long..... **L. piresii**
 8. Flowers sessile or subsessile on primary branches of inflorescence.
 12. Receptacle urceolate.
 13. Leaf apex rounded to retuse; laminae usually orbicular, rarely oblong-elliptic.
 - **L. orbicularis**
 13. Leaf apex acute or acuminate, lamina elliptic or oblong.
 14. Leaf apex acute, margins often revolute.
 15. Receptacle narrowly urceolate; calyx lobes lanceolate; stamens 3..... **L. niloi**
 15. Receptacle broadly urceolate; calyx lobes deltoid; stamens 4-5.... **L. coriacea**
 14. Leaf apex distinctly acuminate, margins plane.
 16. Stamens 3..... **L. affinis**
 16. Stamens 5.
 17. Leaf apex caudate; lamina chartaceous..... **L. teixeirae**
 17. Leaf apex acuminate; lamina coriaceous..... **L. urceolaris**
 12. Receptacle campanulate.
 18. Primary veins and midrib slightly impressed on upper surface; lamina chartaceous; stamens 6-7..... **L. daviliifolia**
 18. Primary veins and midrib plane or prominent; lamina coriaceous; stamens 3-5.
 19. Primary veins prominulous on upper surface; leaves 12-19 cm long. **L. elliptica**
 19. Primary veins plane above; leaves 3.5-12 cm long

20. Stipules axillary; fruit epicarp rufous pubescent.....**L. farinacea**
 20. Stipules adnate to base of petiole; fruit epicarp glabrous.....**L. canescens**
7. Leaf undersurface lanate-arachnoid pubescent or with hair-filled stomatal cavities.
 21. Leaf undersurface with hair filled stomatal cavities.
 22. Flowers borne in cymules on long slender secondary branches attached to the primary inflorescence branches.
 23. Midrib impressed on upper surface of lamina.
 24. Receptacle urceolate; leaves oblong to elliptic.....**L. arianeae**
 24. Receptacle campanulate; leaves oblong-lanceolate.....**L. impressa**
 23. Midrib plane or prominent on upper surface of lamina.
 25. Stamens 3-5; inflorescence puberulous; leaf apex with acumen 6-15 mm long.
**L. pallida**
 25. Stamens 7; inflorescence tomentellous; leaf apex rounded to acute... **L. santosii**
22. Flowers sessile or subsessile on primary branches of inflorescence.
 26. Stamens 3.
 27. Midrib impressed on upper leaf surface; stipules adnate to petiole base; lamina chartaceous.....**L. tocantina**
 27. Midrib plane on upper leaf surface; stipules axillary; lamina coriaceous.
**L. triandra**
26. Stamens 5-11.
 28. Flowers 6-7.5 mm long; stipules triangular, navicular, to 13 mm long.
**L. naviculiflora**
 28. Flowers 1.4-3 mm long; stipules to 7 mm long.
 29. Midrib impressed on leaf upper surface.
 30. Stipules axillary, caducous
 31. Leaves oblong-elliptic; inflorescence brown appressed tomentellous; stomatal cavities covered by lanate pubescence.....**L. areolata**
 31. Leaves ovate-lanceolate; inflorescence grey tomentellous; stomatal cavities conspicuous because of glabrous nerves and veins. **L. crassivenia**
 30. Stipules adnate to base of petioles, persistent.
 32. Receptacle urceolate; exterior of flowers sparsely grey-puberulous not completely covering the surface.....**L. bellingtonii**
 32. Receptacle campanulate or conical; exterior of flowers tomentellous or tomentose.
 33. Lower leaf surface with extremely conspicuous stomatal cavities with pubescence confined to cavities and made obvious by almost glabrous venation; petioles without glands.
 34. Inflorescence and flowers ferrugineous pubescent; leaf apex acute or bluntly acuminate; petioles 3-5 mm.**L. riedelii**
 34. Inflorescence and flower grey-puberulous; leaf apex acuminate; petioles 7-10 mm.....**L. bracteata**
 33. Lower leaf surface with poorly developed stomatal cavities obscured by dense pubescence; petioles with 2 conspicuous glands.
 35. Receptacle conical, 4-5mm long, fruit with stipe 2-6 mm long, epicarp tomentellous; stipules adnate to base of petiole.....**L. majuscula**
 35. Receptacle campanulate, 2.5-3 mm long; fruit with stipe 8-15 mm long, epicarp pulverulent; stipules axillary.....**L. alba**
 29. Midrib plane or prominulous on leaf upper surface.
 36. Receptacle urceolate; exterior of flowers sparsely grey-puberulous not completely covering the surface; flowers c. 3 mm tall.....**L. bellingtonii**
 36. Receptacle campanulate; exterior of flowers tomentellous or puberulous forming a complete covering; flowers c. 2 mm tall.**L. parviflora**
21. Leaf undersurface lanate or lanate arachnoid pubescent, without cavities.
 37. Flowers borne in cymules on long slender secondary branches attached to the primary inflorescence branches.
 38. Lower leaf surface deeply reticulate hidden by dense lanate-arachnoid pubescence
 39. Bracteoles enclosing groups of flower buds, peduncles of cymules short and thick, 1-3 mm long; inflorescence branches brown tomentose.... **L. densiflora**
 39. Bracteoles not enclosing groups of flower buds; peduncles of cymules long and

- slender; inflorescence branches grey puberulous.....**L. dealbata**
38. Leaf lower surface with a fine plane or prominulous venation, short appressed pubescence.
40. Exterior of flowers and inflorescence branches entirely glabrous; leaves oblong to oblong-lanceolate, 3.5-8 cm long.....**L. gracilipes**
40. Exterior of flowers and inflorescence branches grey-puberulous; leaves oblong, 8-19 cm long.....**L. membranacea**
37. Flowers sessile or subsessile on primary branches of inflorescence or on short thick peduncles less than 0.5 mm long.
41. Stamens 3.
42. Receptacle urceolate
43. Stipules axillary or caducous
44. Leaf apex rounded to acute; petioles 2-3mm long; lamina coriaceous.....**L. savannarum**
44. Leaf apex with a finely pointed acumen; petioles 5-6 mm long; lamina membranous.....**L. pruinosa**
43. Stipules adnate to petiole base, usually persistent.
45. Leaf apex rounded to bluntly acute, lamina oval to elliptic; midrib impressed above.....**L. ovalifolia**
45. Leaf apex acute to acuminate; midrib plane above; lamina oblong to oblong-elliptic.
46. Flowers 2 mm tall; interior of receptacle glabrous on upper portion; leaves 3-5.5 x 2-3 cm.....**L. aracaensis**
46. Flowers 4-5 mm tall; interior of receptacle pubescent on upper portion; leaves 4.5-10.5 x 2-5.5 cm.....**L. nitida**
42. Receptacle campanulate
47. Leaf apex acute, midrib plane on upper surface, primary veins 10-12 pairs.
-**L.micrantha**
47. Leaf apex acuminate, midrib usually slightly impressed above; primary veins 5-9.
48. Stipules adnate to petiole base.
49. Inflorescence branches grey puberulous; midrib slightly impressed above.....**L. bahiensis**
49. Inflorescence branches tomentellous; midrib plane above... **L. apiculata**
48. Stipules axillary; inflorescence branches tomentose.....**L. discolor**
41. Stamens 5-11.
50. Stipules adnate to base of petiole.
51. Midrib impressed on leaf upper surface.
52. Leaf base distinctly cordate or subcordate; petioles 1.5-6 mm long.
53. Stamens 8-11; flowers 3-3.5 mm tall.
54. Petioles 1-2 mm; leaf apex retuse to acute; leaf undersurface smooth, waxy appressed lanate.**L. stewardii**
54. Petioles 3-6 mm; leaf apex acuminate; leaf undersurface reticulate, lanate.....**L. mollis**
53. Stamens 5-6; flowers c 2 mm tall.
55. Inflorescence a spike; leaf apex caudate; white lanate pubescent beneath.....**L. nelsonii**
55. Inflorescence a racemose panicle; leaf apex rounded to acute; deeply reticulate under lanate pubescence beneath.....**L. hebantha**
52. Leaf base rounded to cuneate; petioles 8-15 mm long.....**L. paraensis**
51. Midrib plane or prominulous on leaf upper surface.
56. Inflorescence a spike.....**L. incana**
56. Inflorescence a racemose panicle.
57. Petioles 12-20 mm long; leaves 9-22 x 5.5-10 cm.....**L.robusta**
57. Petioles 2.5 -12 mm long; leaves 3-16 x 1.3-7.5 cm
58. Primary leaf veins 8-10 pairs; leaves submechanaceous.....**L.maxima**
58. Primary leaf veins 5-9 pairs; leaves coriaceous.
59. Petioles 7-15 mm; lamina 7-16 x 3-8 cm, stipules subpersistent; inflorescence tomentellous, glabrous or sparsely tomentellous

60. Petioles tomentose; leaf lower surface deeply reticulate....**L. blackii**
 60. Petioles glabrous; leaf lower surface not deeply reticulate.... **L. cidii**
 59. Petioles 2-5 mm; lamina 3-8.5 x 1.3-5 cm, stipules persistent;
 inflorescence sparse grey puberulous.....**L. kunthiana**
50. Stipules axillary, intrapetiolar or caducous.
 61. Inflorescence a spike or glomerule.
 62. Flowers 2.5 mm long; receptacle broadly cupuliform; inflorescence
 puberulous; venation of lower leaf surface conspicuous.....**L. spicata**
 62. Flowers 1.5-2 mm long; receptacle campanulate; inflorescence tomentose;
 venation of leaf lower surface inconspicuous.
 63. Leaves thin and membranous, oblong to oblong-lanceolate, acumen finely
 pointed; flowers in dense glomerules.....**L. leptostachya**
 63. Leaves coriaceous, lanceolate, the apex acute; inflorescence a spike or
 little-branched terminal panicle.....**L. lanceolata**
61. Inflorescence a racemose panicle.
 64. Midrib and usually veins of leaf upper surface impressed.
 65. Leaf base distinctly cordate; inflorescence branches hispid.....**L. cordata**
 65. Leaf base rounded to cuneate; Inflorescence branches not hispid.
 66. Flowers 3.5-5 mm long; receptacle broadly cupuliform.... **L. sandwithii**
 66. Flowers 1.5-2.5 mm long; receptacle campanulate.
 67. Leaf lower surface with parallel secondary veins, giving a
 prominently reticulate appearance.....**L. laxiflora**
 67. Leaf lower surface lanate, but not prominently reticulate.
 68. Stipules linear, c. 5 mm long, persistent.....**L. vaupesiana**
 68. Stipules not exceeding 2.5 mm long, often caducous.
 69. Leaves oblong-lanceolate.....**L. indurata**
 69. Leaves ovate-elliptic to oblong.
 70. Inflorescence much branched, spreading, lax; lower leaf surface
 rufous pubescent.....**L. rufescens**
 70. Inflorescence densely crowded, compact, little-branched; lower
 leaf surface grey-brown pubescent.
 71. Leaves finely acuminate, the acumen 8-12 mm long; stipules
 caducous..**L. harlingii**
 71. Leaf apex acute or bluntly acuminate; stipules persistent....
 **L. hoehnei**
64. Midrib of upper leaf surface plane or prominulous.
 72. Petioles 10-15 mm long; receptacle velutinous on exterior.
 73. Leaves thickly coriaceous with recurved margins; apex apiculate;
 flowers 4.5-5.5 mm long.....**L. lamentanda**
 73. Leaves chartaceous, finely acuminate at apex; flowers 2-2.5 mm long..
 **L. belemii**
72. Petioles 6-12 mm long; receptacle rarely velutinous, only *L. rodrieguesii*
 74. Inflorescence puberulous; young leaves without glands at junction with
 petiole; receptacle velutinous pubescent; primary leaf veins 6-7
 pairs.....**L. rodrieguesii**
 74. Inflorescence brown-tomentellous, young leaves with large glands at
 junction with petiole; receptacle tomentellous; primary leaf veins
 10-13 pairs..... **L. ferreira**

Licania affinis Fritsch

Has as synonym

Licania schomburgkiana Klotzsch

DESCRIPTION

Leaf: shape elliptic/oblong; **abaxial indumentum** waxy/pulverulent farinaceous; **petiole gland(s)** present. **Inflorescence:** type racemose panicle. **Flower:** receptacle shape urceolate; **pedicel** sessile; **stamen number** 3; **filament length** included; **filament fusion** free. **Fruit:** **epicarp** smooth/glabrous.

ADDITIONAL DESCRIPTION

Trees. Branches glabrous when young, lenticellate. Leaves: stipules linear, 3-5 mm long, coriaceous, persistent, adnate to base of petiole; petioles 3-6 mm long, glabrous, rugose, shallowly canaliculate, with 2 obscure sessile glands near to lamina; lamina elliptic to oblong, thick-coriaceous, 5-15.5 × 2.5-6.7 cm, acuminate at apex with acumen 3-12 mm long, subcordate to subcuneate at base glabrous above, with waxy brown pulverulent-farinaceous pubescence beneath; margins plane; midrib glabrous above, prominulous; primary veins 4-7 pairs, arcuate, prominent beneath, prominulous above. Inflorescence of little-branched terminal and axillary racemose panicles; rachis and branches glabrous to glabrescent. Flowers c. 3 mm long, on primary branches of inflorescence. Bracts and bracteoles 0.3-1 mm long, deltoid, persistent, puberulous on exterior. Receptacle urceolate, sessile, tomentellous on exterior, sparsely puberulous within. Calyx lobes acute, tomentellous on both surfaces. Petals absent. Stamens 3, unilateral; filaments shorter than calyx lobes, glabrous, free to base. Ovary short-tomentose. Style equalling filaments, pubescent throughout. Fruit to 4 cm long with stipe c. 1 cm long, pyriform; epicarp glabrous, drying yellow and wrinkled; mesocarp thin; endocarp thick, hard, granular and fibrous, sparsely hirsutulous within.

Licania alba (Bernoulli) Cuatrec.

Has as synonym

homotype *Theobroma alba* Bernoulli
 heterotypic *Licania longifolia* Benoist
 heterotypic *Licania venosa* Rusby

DESCRIPTION

Leaf: shape elliptic/oblong-elliptic; **abaxial indumentum** stomatal-cavity/lanate-pubescent; **petiole gland(s)** absent/present.
Inflorescence: type racemose panicle. **Flower:** receptacle shape campanulate; **pedicel** sessile; **stamen number** 6 - 8; **filament length** included; **filament fusion** free. **Fruit:** epicarp pulverulent.

ADDITIONAL DESCRIPTION

Tree to 35 m tall. Branches pulverulent when young, becoming glabrous with age. Leaves with stipules elliptic, to 7 mm long, subpersistent, axillary; petioles 9-17 mm long, short-tomentellous-pubescent, canaliculate, usually with medial glands; lamina oblong-elliptic to elliptic, coriaceous, 9-27 × 4-10 cm, acuminate at apex with acumen 3-10 mm long, rounded at base, glabrous above; lower surface with deep stomatal cavities rather obscured by dense lanate pubescence; midrib impressed above for entire length, pulverulent near base but becoming glabrous with age; primary veins 8-12 pairs, prominent beneath, impressed and glabrous above. Inflorescences terminal and axillary racemose panicles; rachis and branches tomentellous-pubescent. Flowers 2.5-3 mm long, sessile on primary and secondary branches of inflorescence. Bracts and bracteoles ovate, to 4 mm long, persistent, often with paired glands at base, tomentellous on exterior. Receptacle campanulate, sessile, tomentellous on exterior, tomentose within. Calyx lobes acute, tomentellous on both surfaces. Petals absent. Stamens 6-8, inserted in a complete circle; filaments shorter than calyx lobes, pubescent, free to base. Ovary villous. Style equalling filaments, lanate throughout. Fruit pyriform, to 9 cm long, including stipe to 15 mm long; epicarp sordid ferruginous-brown pulverulent; mesocarp thin, very hard, sparsely hirsutulous within.

Licania apiculata Prance

DESCRIPTION

Leaf: shape oblong/oblong lanceolate; **abaxial indumentum** lanate-pubescent; **petiole gland(s)** absent. **Inflorescence:** type racemose panicle. **Flower:** **receptacle shape** campanulate; **pedicel** sessile; **stamen number** 3; **filament length** included; **filament fusion** free. **Fruit:** **epicarp** pubescent.

ADDITIONAL DESCRIPTION

Shrubs. Branches glabrous not lenticellate when young. Leaves: stipules linear, to 2 mm long, glabrous, caducous, adnate to base of petiole; petioles 3-4 mm long, glabrescent, terete, eglandular; lamina oblong or oblong-lanceolate, coriaceous, $5-10 \times 1.7-3.5$ cm, apiculate at apex, cuneate at base, glabrous and shiny above, densely lanate-pubescent beneath; midrib glabrous and plane above; secondary veins 10-12 pairs, slightly prominent on both surfaces. Inflorescences of terminal racemose panicles; rachis and branches puberulous or tomentellous. Bracts and bracteoles 1-3 mm long, linear, small, persistent, puberulous on exterior. Flowers 2-3 mm long. Receptacle campanulate, sessile, tomentose on exterior, tomentellous within. Calyx lobes acute, tomentellous on both surfaces. Petals absent. Stamens 3, unilateral; filaments glabrous, free to base, shorter than calyx lobes. Ovary tomentellous. Style pubescent to apex. Fruit (immature) pyriform; exocarp sordid-pubescent.

Licania aracaensis Prance

DESCRIPTION

Leaf: shape oblong; **abaxial indumentum** lanate tomentose; **petiole gland(s)** absent. **Inflorescence:** type racemose panicle. **Flower:** receptacle shape urceolate; **pedicel** sessile; **stamen number** 3; **filament length** included; **filament fusion** free. **Fruit:** **epicarp** glabrous.

ADDITIONAL DESCRIPTION

Tree to 2 m tall. Branches puberulous when young, soon becoming glabrous and lenticellate. Leaves: stipules persistent, lanceolate, 1-1.5 mm long, adnate to base of petiole; petioles 3-4 mm long, terete, sparsely puberulous, eglandular; lamina oblong, conduplicate, coriaceous, 3-5.5 × 2-2.8 cm, subcuneate at base, acute to bluntly acuminate at apex with acumen 2-6 mm long, glabrous above, densely lanate-tomentose beneath; midrib plane above, prominulous beneath; primary veins 6-8 pairs, plane above, prominulous beneath. Inflorescences terminal and subterminal racemose panicles 4-7.5 cm long; rachis and branches puberulous. Bracts and bracteoles triangular, persistent, tomentose on exterior, c. 0.75 mm long. Flowers c. 2 mm long. Receptacle urceolate, sessile, yellow-tomentellous on exterior, tomentose towards base within. Petals absent. Stamens 3, unilateral, opposite 3 calyx lobes; filaments glabrous, shorter than calyx lobes. Ovary tomentose. Style puberulous, shorter than calyx lobes. Fruit pyriform; exocarp glabrous, wrinkled when dry; stipe 5-10 mm in dry fruit.

Licania areolata Prance

DESCRIPTION

Leaf: shape oblong-elliptic; **abaxial indumentum** stomatal-cavity/lanate-pubescent; **petiole gland(s)** absent. **Inflorescence:** type racemose panicle. **Flower:** receptacle shape campanulate/globose; **pedicel** sessile; **stamen number 5**; **filament length** included; **filament fusion** free. **Fruit:** epicarp rufous velutinous.

ADDITIONAL DESCRIPTION

Trees to 25 m tall, the young branches sparsely puberulous, soon glabrous. Leaves: stipules axillary, ovate, 1 mm long, caducous; petioles 6 – 12 mm long, slightly canaliculate, eglandular; lamina oblong-elliptic, thinly coriaceous, 5 – 8.5 × 1.5 – 3.5 cm; finely acuminate at apex, the acumen 5 – 15 mm long, cuneate at base; glabrous above, lanate pubescent and deeply reticulate with stomatal cavities beneath; midrib slightly impressed above, prominent and sparsely puberulous beneath; primary veins 7 – 8 plane or slightly impressed above, prominulous beneath. Inflorescence of terminal and subterminal racemose panicles, rachis and branches appressed tomentellous. Bracts and bracteoles minute, triangular c 1 mm long, tomentellous on exterior, almost glabrous within. Flowers c. 2 mm long, sessile. Receptacle campanulate-globular, grey tomentellous on exterior, tomentose within; calyx lobes triangular, acute, 0.4 mm long, tomentellous on both surfaces. Petals absent. Stamens 5, unilateral, filaments shorter than calyx lobes. Ovary inserted at base, of receptacle, tomentose; style inserted at base of ovary sparse puberulous. Fruit orbicular and slightly narrowed towards peduncle, 4.5 × 4.5 cm, exocarp velvety rufous-brown.

DESCRIPTION

Leaf: shape oblong-elliptic/oblong; **abaxial indumentum** stomatal-cavity; **petiole gland(s)** absent. **Inflorescence:** type panicle. **Flower:** receptacle shape urceolate; **pedicel** sessile; **stamen number** 6 - 7; **filament length** included; **filament fusion** free. **Fruit:** epicarp unknown.

ADDITIONAL DESCRIPTION

Trees to 20 m tall. Branches densely ferruginous-tomentose when young. Leaves: stipules 6-10 mm long, 1.5-2 mm broad at base, lanceolate, persistent, adnate to extreme base of petiole; petioles 6-8 mm long, densely ferruginous-pubescent, canaliculate; lamina oblong to oblong-elliptic, coriaceous, 7-11 × 3.5-5 cm, rounded to subcuneate at base, bluntly acuminate or acute at apex with acumen 0-5 mm long, glabrous above, with conspicuous deep-set stomatal cavities beneath, filled with a lanate white pubescence; midrib impressed for entire length above, prominent and ferruginous-tomentose beneath; primary veins 10-15 pairs, plane above, prominent and with a few sparse hairs beneath. Inflorescences of terminal and subterminal panicles; rachis and branches densely ferruginous-tomentose. Bracts and bracteoles minute, c. 1 mm long, persistent. Flowers 5-6 mm long, inserted in small groups of cymules attached to primary branches by short thick peduncles; receptacle urceolate, slightly gibbous, tomentose on exterior, lanate within. Calyx lobes acute, tomentose on both surfaces. Petals absent. Stamens 6 or 7, unilateral with large lanate ridge opposite bearing short staminodes; filaments shorter than calyx lobes, unequal in length. Ovary inserted at base of receptacle, villous; style exceeding filaments in length, lanate for entire length. Fruit not seen.

DESCRIPTION

Leaf: shape oblong-elliptic; **abaxial indumentum** lanate-pubescent; **petiole gland(s)** absent. **Inflorescence:** type racemose panicle. **Flower:** receptacle shape campanulate; **pedicel** sessile; **stamen number** 3; **filament length** included; **filament fusion** free. **Fruit:** **epicarp** unknown.

ADDITIONAL DESCRIPTION

Trees. Branches glabrous when young, lenticellate. Leaves: stipules c. 3 mm long, persistent, lanceolate, puberulous, adnate to base of petiole; petioles 5-6 mm long, puberulous, terete, eglandular; lamina oblong-elliptic, coriaceous, $5.5-8 \times 2.5-4.5$ cm, apiculate to acuminate at apex with acumen 1-5 mm long, rounded to subcuneate at base, glabrous above, densely lanate-pubescent beneath; venation plane; midrib glabrous, slightly impressed above; primary veins 6-8 pairs, prominent beneath, plane above. Inflorescences in terminal and axillary racemose panicles; rachis and branches grey-puberulous. Bracts and bracteoles 0.5-1.5 mm long, ovate, persistent, puberulous on exterior. Flowers c. 2 mm long. Receptacle campanulate, sessile, grey-tomentellous on exterior, tomentose within. Calyx lobes acute, tomentellous on exterior, puberulous within. Petals absent. Stamens 3, unilateral; filaments glabrous, free to base, shorter than calyx lobes. Ovary villous. Style pubescent to apex. Fruit not seen.

Licania bracteata Prance

DESCRIPTION

Leaf: shape elliptic/oblong-elliptic; **abaxial indumentum** stomatal-cavity; **petiole gland(s)** absent. **Inflorescence:** type racemose panicle. **Flower:** receptacle shape campanulate; **pedicel** subsessile; **stamen number** 5; **filament length** included; **filament fusion** free. **Fruit:** epicarp velutinous pubescent.

ADDITIONAL DESCRIPTION

Trees. Branches puberulous when young, soon becoming glabrous and lenticellate. Leaves: stipules lanceolate c. 4 mm long, puberulent, subpersistent, adnate to base of petiole; petioles 7-10 mm long, tomentellous when young, terete, eglandular; lamina elliptic to oblong-elliptic, coriaceous, 5.5-16.5 × 2.5-8 cm, glabrous above, with stomatal cavities with lanate-pubescent apertures beneath; venation between glabrous and conspicuous; apex acute or usually acuminate with acumen 3-15 mm long; base rounded to subcordate; midrib impressed above, glabrous; primary veins 8-10 pairs, prominent beneath, plane and conspicuous above. Inflorescences of terminal and axillary racemose panicles; rachis and branches puberulous. Flowers c. 2 mm long. Bracts and bracteoles lanceolate, to 2.5 mm long, persistent, puberulous on exterior. Receptacle campanulate, subsessile, grey-tomentellous on exterior, puberulous within. Calyx lobes acute, tomentellous on both surfaces. Petals absent. Stamens 5, unilateral; filaments shorter than calyx lobes, pubescent. Ovary villous; style lanate. Fruit oblong, to 7 × 4 cm; exocarp velutinous pubescent; mesocarp thin; endocarp c. 6 mm thick, woody and hard, glabrous within.

Licania canescens Benoist

DESCRIPTION

Leaf: shape elliptic/oblong-elliptic; **abaxial indumentum** waxy/pulverulent furfuraceous; **petiole gland(s)** absent.
Inflorescence: type racemose panicle. **Flower:** receptacle shape campanulate; **pedicel** sessile; **stamen number** 5; **filament length** included; **filament fusion** free. **Fruit:** epicarp smooth/glabrous.

ADDITIONAL DESCRIPTION

Trees to 20 m tall. Branches glabrous when young, lenticellate. Leaves: stipules 2-4 mm long, linear, persistent, adnate to base of petiole; petioles 3-5 mm long, glabrous, terete or shallowly canaliculate, eglandular, transversely rugose; lamina elliptic to oblong-elliptic, coriaceous, 4-12 × 2-5.5 cm, acuminate at apex with acumen 4-15 mm long, rounded to cuneate at base; margins plane; upper surface glabrous; lower surface with waxy grey pulverulent-furfuraceous pubescence; midrib glabrous above, plane; primary veins 6-9 pairs, prominent beneath, plane above. Inflorescences terminal and axillary racemose panicles; rachis and branches glabrous or sparsely puberulous. Flowers c. 2 mm long, in small groups on primary branches of inflorescence. Receptacle campanulate, sessile, tomentellous on exterior, tomentose within. Calyx lobes acute, tomentellous on both surfaces. Petals absent. Stamens 5, unilateral; filaments shorter than calyx lobes, glabrous, free to base. Ovary tomentose. Style equalling filaments, sparsely pubescent throughout. Fruit pyriform, c. 3 cm long; epicarp glabrous, drying yellow and wrinkled; mesocarp thin; endocarp hard, thick, fibrous, hirsutulous within.

Licania cidii Prance

DESCRIPTION

Leaf: shape elliptic; **abaxial indumentum** tomentose; **petiole gland(s)** absent. **Inflorescence:** type panicle. **Flower:** receptacle shape campanulate; **pedicel** sessile; **stamen number** 6 - 7; **filament length** included; **filament fusion** free. **Fruit:** epicarp unknown.

ADDITIONAL DESCRIPTION

Trees to 30 m tall. Branches glabrous when young, conspicuously lenticellate. Leaves: stipules adnate to base of petiole, subpersistent, lanceolate, 2-3 mm long, glabrous; petioles 8-15 mm long, terete, eglandular, glabrous; lamina elliptic, chartaceous, 7-14 × 3.5-8 cm, subcuneate at base, with pointed slightly curved acumen 9-20 mm long, glabrous on upper surface, densely tomentose beneath (pubescence between the reticulate venation, and hard to remove); midrib prominulous above, prominent and glabrous beneath; primary veins 5-7 pairs, plane above, prominent and glabrous beneath. Inflorescences of terminal and axillary panicles 7-17 cm long; rachis and primary branches glabrous or sparsely puberulous and secondary branches sparsely tomentellous. Bracts and bracteoles minute, caducous. Flowers 2.5-3 mm long, sessile on secondary branches of inflorescence. Receptacle campanulate, grey velutinous-tomentellous on exterior, pubescent within. Calyx lobes 5, acute, tomentellous on both surfaces. Petals absent. Stamens 6 or 7, inserted around 2/3 of circle; filaments shorter than calyx lobes, glabrous, free to base, with a pilose ring of hairs at their base. Ovary inserted at base of receptacle, tomentose. Style extending to level of anthers, tomentellous almost to apex. Fruit not seen.

Licania coriacea Benth.

This treatment is composed of the following taxa: *Licania coriacea*, .

Has as synonym

heterotypic *Licania pallidula* Standl.

DESCRIPTION

Leaf: shape elliptic/oblong ovate; **abaxial indumentum** waxy/pulverulent furfuraceous; **petiole gland(s)** absent. **Inflorescence:** type racemose panicle. **Flower:** receptacle shape urceolate; **pedicel** sessile; **stamen number** 4/5; **filament length** included; **filament fusion** free. **Fruit:** epicarp glabrous.

ADDITIONAL DESCRIPTION

Trees to 25 m tall. Branches puberulous when young, soon becoming glabrous and lenticellate. Leaves: stipules 2-4 mm long, lanceolate, coriaceous, adnate to base of petiole, persistent; petioles 3-6 mm long, eglandular, terete, pulverulent, becoming glabrescent with age; lamina elliptic to oblong-ovate, thick-coriaceous, 3-12 × 1.5-5 cm, acute or acuminate at apex with acumen to 6 mm long, cuneate to subcuneate at base; margins revolute; upper surface glabrous; lower surface waxy grey pulverulent-furfuraceous pubescent; midrib glabrous above, plane or slightly impressed; primary veins 6-8 pairs, prominulous beneath, plane above. Inflorescences little branched terminal and axillary racemose panicles; rachis and branches tomentellous to puberulous. Flowers 3 mm long, solitary or in small groups along primary branches of inflorescence. Bracts and bracteoles 0.5-2.5 mm long, deltoid, persistent, tomentellous on exterior. Receptacle urceolate, sessile, tomentellous on exterior, and within. Calyx lobes acute, tomentellous on both surfaces. Petals absent. Stamens 4 or 5, unilateral; filaments shorter than calyx lobes, glabrous, free to base. Ovary tomentose. Style equaling filaments, tomentose. Fruit pyriform, 2.5-3 cm long; epicarp glabrous, drying yellow and wrinkled; mesocarp thin; endocarp c. 3 mm thick, hard, granular and fibrous, velutinous within.

Licania crassivenia Spruce ex Hook.f.

DESCRIPTION

Leaf: shape ovate lanceolate; **abaxial indumentum** stomatal-cavity; **petiole gland(s)** absent. **Inflorescence:** type racemose panicle. **Flower:** receptacle shape campanulate; **pedicel** sessile; **stamen number** 5 - 7; **filament length** included; **filament fusion** free. **Fruit:** epicarp unknown.

ADDITIONAL DESCRIPTION

Shrubs. Branches glabrous when young, obscurely lenticellate. Leaves: stipules to 2 mm long, lanceolate, puberulous, caducous; petioles 8-12 mm long, glabrous, shallowly canaliculate, eglandular; lamina ovate-lanceolate, coriaceous, 5-8 × 1.5-3.8 cm, tapering to a fine point at the apex with acumen 3-7 mm long, subcuneate at base, glabrous above; lower surface with well developed stomatal cavities which are filled by lanate pubescence; venation glabrous and hence the cavities conspicuous; midrib slightly impressed above, glabrous; primary veins 7-10 pairs, prominent beneath, impressed above. Inflorescences terminal racemose panicles; rachis and branches grey-puberulous. Flowers c. 3 mm long, sessile on primary branches of inflorescence. Bracts and bracteoles to 2 mm long, lanceolate, persistent, puberulous. Receptacle campanulate, sessile, grey-puberulous on exterior, lanate within. Calyx lobes acute, puberulous on both surfaces. Petals absent. Stamens 5-7, unilateral; filaments shorter than calyx lobes, glabrous, free to base. Ovary pilose. Style rising to base of filaments, lanate. Fruit unknown.

Licania cymosa Fritsch

DESCRIPTION

Leaf: shape oblong-elliptic; **abaxial indumentum** farinaceous; **petiole gland(s)** absent. **Inflorescence:** type panicle. **Flower:** receptacle shape urceolate; **pedicel** sessile; **stamen number** 5 - 6; **filament length** included; **filament fusion** free. **Fruit:** **epicarp** waxy.

ADDITIONAL DESCRIPTION

Trees. Branches glabrous when young, prominently lenticellate. Leaves: stipules linear, persistent, 1-2 mm long, adnate to extreme base of petiole; petioles 1.5-2 mm long, glabrous, eglandular, terete; lamina oblong-elliptic, thick-coriaceous, 2-5 × 1.3-3.2m, revolute at margins, rounded at apex, subcuneate at base; upper surface glabrous; lower surface persistently grey-farinaceous; midrib plane above, glabrous; primary veins 5-6 pairs, prominulous beneath, plane above. Inflorescences terminal and axillary cymose panicles; rachis and branches glabrous. Flowers c. 3 mm long, in small cymules on slender peduncles attached to rachis and primary branches of inflorescence. Bracts and bracteoles 0.5-1 mm long, lanceolate, puberulous, persistent. Receptacle urceolate, sessile, short-grey-tomentose on exterior, tomentose within. Calyx lobes acute, tomentellous on both surfaces. Petals absent. Stamens 5 or 6, unilateral; filaments shorter than calyx lobes, glabrous, free to base. Ovary villous. Style equalling filaments, pilose. Fruit globose, 2-2.5 cm diam.; epicarp waxy; pericarp thick, fibrous, sparsely hirsutulous within.

Licania davillifolia Benoist

DESCRIPTION

Leaf: shape oblong-elliptic; **abaxial indumentum** waxy/pulverulent farinaceous; **petiole gland(s)** absent/present. **Inflorescence:** type panicle. **Flower:** receptacle shape campanulate; **pedicel** sessile; **stamen number** 6 - 7; **filament length** included; **filament fusion** free. **Fruit:** epicarp rufous pubescent.

ADDITIONAL DESCRIPTION

Trees. Branches glabrous when young, lenticellate. Leaves: stipules 1-3 mm long, linear, coriaceous, persistent, adnate to base of petiole; petioles 6-10 mm long, glabrescent to puberulous, shallowly canaliculate, eglandular or with inconspicuous glands, rugose; lamina oblong-elliptic, chartaceous, $6-21 \times 3.5-8.5$ cm, short-acuminate at apex with acumen 3-10 mm long, rounded at base, glabrous above, with waxy grey pulverulent-farinaceous pubescence beneath; margins plane; midrib glabrous above, impressed; primary veins 7-10 pairs, prominent beneath, impressed above; secondary nerves more or less parallel, prominent beneath; venation of upper surface usually papillose. Inflorescences terminal and axillary spreading branched panicles; rachis and branches tomentellous to puberulous. Flowers 1.5-2 mm long, solitary on primary and secondary branches of inflorescence. Bracts and bracteoles 0.3-1 mm long, deltoid to lanceolate, persistent, exterior tomentellous. Receptacle campanulate, sessile, tomentose on exterior, tomentose within. Calyx lobes acute, tomentose on both surfaces. Petals absent. Stamens 6 or 7, unilateral; filaments shorter than calyx lobes, glabrous, free to base. Ovary tomentose. Style equalling filaments, sparsely pubescent throughout. Fruit ovoid to pyriform, c. 3.2 cm long; epicarp densely and compactly rufous-pubescent; pericarp thick, granular, fibrous, densely hirsutulous within.

Licania dealbata Hook.f.

DESCRIPTION

Leaf: shape oblong/oblong ovate; **abaxial indumentum** lanate-pubescent; **petiole gland(s)** absent. **Inflorescence:** type panicle. **Flower:** receptacle shape campanulate; **pedicel** pedicellate; **stamen number** 6 - 7; **filament length** included; **filament fusion** free. **Fruit:** **epicarp** short velutinous.

ADDITIONAL DESCRIPTION

Shrubs or a low suffrutex. Branches puberulous when young, becoming glabrous with age, obscurely lenticellate. Leaves: stipules lanceolate, 3-5 mm long, coriaceous, persistent, adnate to extreme base of petiole; petioles 2-5 mm long, pubescent, eglandular, terete; lamina oblong to oblong-ovate, coriaceous, 4-7 × 2-3.5 cm, acuminate or acute at apex with acumen to 5 mm long; upper surface glabrous; lower surface with deep reticulation obscured by dense lanate white pubescence; midrib plane or slightly impressed above, sparsely pubescent towards base; primary veins 6-8 pairs, prominent beneath, more or less plane above. Inflorescences terminal and axillary panicles; rachis and branches grey-puberulous. Flowers c. 2.5 mm long, in few-flowered cymules attached to primary branches by long slender peduncles. Bracts and bracteoles 0.2-1 mm long, ovate, persistent, puberulous on exterior. Receptacle campanulate, grey-tomentellous on exterior, tomentellous within; pedicels c. 0.25 mm long. Calyx lobes acute, tomentellous-puberulous on both surfaces. Petals absent. Stamens 6 or 7, unilateral; filaments shorter than calyx lobes, glabrous, free to base. Ovary villous. Style equalling filaments, sparsely pubescent throughout. Fruit pyriform, c. 2 cm long; epicarp with short-appressed-velutinous pubescence; mesocarp thick, hard, fibrous; endocarp thin, hard, fibrous, hirsutulous within.

Has as synonym

heterotypic *Licania kanukuensis* Standl.

DESCRIPTION

Leaf: shape elliptic/oblong; **abaxial indumentum** glabrous; **petiole gland(s)** absent. **Inflorescence:** type panicle. **Flower:** receptacle shape campanulate; **pedicel** subsessile; **stamen number** 5 - 6/6 - 7; **filament length** included; **filament fusion** free. **Fruit:** epicarp tomentose/rufous pubescent.

ADDITIONAL DESCRIPTION

Trees to 30 m tall. Branches tomentose when young, soon becoming glabrous and lenticellate. Leaves: stipules linear, 2-7 mm long, pubescent, subpersistent, adnate to extreme base of petiole; petioles 3-10 mm long, terete, lanate-tomentose, eglandular; lamina oblong to elliptic, coriaceous, 5-15 × 2-7.5 cm, acute to shortly acuminate at apex with acumen 3-7 mm long, rounded to subcuneate at base; midrib slightly impressed or plane above, glabrous; primary veins 9-11 pairs, prominent beneath, plane above. Inflorescences densely flowered terminal and subterminal panicles; rachis and branches densely tomentose. Flowers 4-5 mm long, in small groups of cymules attached to rachis and primary branches by short thick peduncles. Bracts and bracteoles c. 2 mm long, persistent, enclosing buds in small groups, tomentose on exterior. Receptacle campanulate, subsessile, tomentose on exterior, tomentose within. Calyx lobes acute, tomentellous on both surfaces. Petals absent. Stamens 5-7, unilateral; filaments shorter than calyx lobes, glabrous. Ovary villous. Style equalling filaments, lanate for most of length. Fruit pyriform, with short stipe c. 5 mm long; epicarp rufous-tomentose; pericarp thin, very hard, fibrous, densely hirsutulous within.

Licania discolor Pilg.

DESCRIPTION

Leaf: shape oblong/ovate; **abaxial indumentum** lanate; **petiole gland(s)** absent. **Inflorescence:** type racemose panicle. **Flower:** receptacle shape campanulate; **pedicel** pedicellate; **stamen number** 3; **filament length** included; **filament fusion** free. **Fruit:** **epicarp** rufous velutinous.

ADDITIONAL DESCRIPTION

Trees to 35 m tall. Branches tomentellous when young, soon becoming glabrous and lenticellate. Leaves: stipules to 3 mm long, lanceolate, deciduous; petioles 3-7 mm long, tomentellous when young, terete, eglandular; lamina oval to oblong, thick-coriaceous, 3-9 × 1.5-4.5 cm, with finely pointed acumen 4-12 mm long at apex, subcuneate at base, glabrous above, densely lanate below; midrib slightly impressed above, glabrous; primary veins 7-9 pairs, prominent beneath, plane above. Inflorescences terminal racemose panicles; rachis and branches tomentose. Flowers 1.5-2 mm long; sessile on primary branches of inflorescence. Bracts and bracteoles to 1 mm long, ovate, subpersistent, tomentellous on exterior. Receptacle campanulate, tomentose on exterior and within; pedicels 0-0.25 mm long. Calyx lobes acute, tomentose on exterior, puberulous within. Petals absent. Stamens 3, unilateral; filaments shorter than calyx lobes, glabrous. Ovary villous. Style rising to base of filaments, sparsely pubescent throughout. Fruit (immature) pyriform, with a short stipe; epicarp rufous-velutinous.

Licania elliptica Standl.

Has as synonym

heterotypic *Licania paniculata* Fanshawe & Maguire

DESCRIPTION

Leaf: shape elliptic; **abaxial indumentum** waxy/pulverulent farinaceous; **petiole gland(s)** present. **Inflorescence:** type panicle. **Flower:** receptacle shape campanulate; **pedicel** sessile; **stamen number** 3 - 5; **filament length** included; **filament fusion** free. **Fruit:** **epicarp** smooth/glabrous.

ADDITIONAL DESCRIPTION

Trees. Branches glabrous when young, lenticellate. Leaves: stipules to 3 mm long, linear, coriaceous, persistent, adnate to extreme base of petiole; petioles 4-7 mm long, glabrous, shallowly canaliculate, often with 2 rather obscure medial sessile glands; lamina elliptic, coriaceous, (10.5-) 12-19 × 4-8 cm, with well developed acumen 5-15 mm long at apex, rounded to cuneate at base; margins plane; upper surface glabrous, with 2 glands at margin towards base; lower surface with waxy grey pulverulent-farinaceous pubescence; midrib glabrous above, prominulous; primary veins 8-9 pairs, prominent beneath, prominulous above. Inflorescences terminal and axillary spreading branched panicles; rachis and branches glabrous or sparsely puberulous. Flowers c. 1.5 mm long, in small groups on short thick peduncles attached to primary and secondary branches of inflorescence. Bracts and bracteoles 0.3-1 mm long, deltoid, persistent, puberulous on exterior. Receptacle campanulate, sessile, tomentellous on exterior, puberulous within. Calyx lobes acute, puberulous on both surfaces. Petals absent. Stamens 3-5, unilateral; filaments shorter than calyx lobes, glabrous, free to base. Ovary tomentose. Style equalling filaments, sparsely pubescent throughout. Fruit pyriform, c. 3.6 cm long; epicarp glabrous, drying wrinkled and yellow; mesocarp thin; endocarp thick, hard, fibrous, hirsutulous within.

Licania farinacea Prance

DESCRIPTION

Leaf: shape elliptic/oblong; **abaxial indumentum** pulverulent farinaceous; **petiole gland(s)** absent. **Inflorescence:** type racemose panicle. **Flower:** receptacle shape campanulate; **pedicel** pedicellate; **stamen number** 5; **filament length** included; **filament fusion** free. **Fruit:** epicarp rufous velutinous.

ADDITIONAL DESCRIPTION

Trees to 20 m tall. The young branches sparsely appressedpuberulous, glabrescent, lenticellate. Leaves: stipules linear, 2 mm long, axillary or inserted on extreme base of petiole at junction with stem, early caducous; petioles 3 – 5 mm long, puberulous, eglandular, shallowly canaliculate; lamina oblong to elliptic, coriaceous, 3.5 – 10 × 2 – 4.8 cm, acuminate or apiculate at apex, the acumen 2 – 8 mm long, subcuneate to rounded at base, glabrous and shiny above, densely pale-brown pulverulentfarinaceous pubescent beneath (noted as pallid beneath when fresh in field notes); midrib plane and glabrous above slightly prominent and sparsely puberulous beneath; primary veins 6 – 7 pairs, plane above, prominulous beneath; secondary venation smooth and inconspicuous. Inflorescence of terminal and subterminal racemose panicles, rachis and branches brown-puberulous. Bracts and bracteoles ovate-triangular. 0.5 – 1 mm long, tomentellous, persistent. Flowers 1.5 – 2 mm long, with short pedicels 0.2 – 0.4 mm long. Receptacle campanulate, grey tomentellous on exterior, tomentose within; calyx lobes triangular, acute, c. 0.4 mm long, tomentellous on exterior, sparsely tomentellous within. Petals absent. Stamens 5, unilateral, filaments glabrous, free to base, shorter than calyx lobes. Ovary inserted at base of receptacle, tomentose; style inserted at base of ovary pubescent almost to apex. Fruit pyriform, narrowed to a stipe 1 cm long and the swollen part to 4 cm long, 3.5 cm broad; exocarp with a dense rufous-velutinous pubescence; pericarp thin, hard, fibrous.

Licania ferreiraiae Prance

DESCRIPTION

Leaf: shape elliptic; **abaxial indumentum** tomentulose; **petiole gland(s)** absent. **Inflorescence:** type racemose panicle. **Flower:** receptacle shape campanulate; **pedicel** sessile; **stamen number** 5; **filament length** included; **filament fusion** free. **Fruit:** **epicarp** unknown.

ADDITIONAL DESCRIPTION

Trees to 30 m tall. Branches puberulous when young, glabrescent, conspicuously lenticellate. Leaves: stipules caducous (not seen); petioles 7-10 mm long, terete, puberulous when young, eglandular; lamina elliptic, coriaceous, 5-9 × 3-5 cm, abruptly acuminate at apex with acumen 4-6 mm long, rounded at base, glabrous above, with compact tomentellous pubescence beneath between venation; young leaves with 2 large and conspicuous saucerlike glands at junction between lamina and petiole, caducous and not visible in mature leaves and with 2 or 3 marginal glands towards apex which persist in some mature leaves only; midrib plane above, prominent beneath; primary veins 10-13 pairs, plane above, prominulous beneath. Inflorescences of terminal and subterminal little-branched racemose panicles, 5-7 cm long; rachis and branches brown-tomentellous. Bracts and bracteoles ovate to lanceolate, 0.5-0.75 mm, tomentellous on exterior, caducous. Flowers c. 2 mm long, borne singly on primary branches and rachis of inflorescence. Receptacle campanulate, tomentellous on exterior, tomentellous within. Calyx lobes acute, tomentellous on both surfaces. Petals absent. Stamens 5, unilateral; filaments free, glabrous, shorter than calyx lobes. Ovary inserted at base of receptacle, tomentose. Style equalling filaments in length, pubescent to apex. Fruit not seen.

Licania glazioviana Warm.

DESCRIPTION

Leaf: shape elliptic; **abaxial indumentum** glabrous; **petiole gland(s)** absent. **Inflorescence:** type racemose panicle. **Flower:** receptacle shape urceolate; **pedicel** sessile; **stamen number** 5; **filament length** included; **filament fusion** fused basally. **Fruit:** **epicarp** waxy.

ADDITIONAL DESCRIPTION

Trees. Branches glabrous and conspicuously lenticellate when young. Leaves: stipules lanceolate, 1.5-2.5 mm long, glabrous, adnate to petiole base, persistent; petioles 2-4 mm long, glabrous, canaliculate, eglandular; lamina oblong-lanceolate to narrowly elliptic, membranous, 3-6.5 × 1.4-2.5 cm, bluntly acuminate or obtuse at apex with acumen to 5 mm long, cuneate at base, glabrous on both surfaces; palisade glands present; midrib prominulous above, glabrous; primary veins 10-12 pairs, prominulous on both surfaces, but rather indistinct; venation papillose on lower surface. Inflorescences short axillary and terminal racemose panicles; rachis and branches almost glabrous. Flowers c. 3.5 mm long, solitary and sessile on primary branches of inflorescence. Bracts and bracteoles 0.5-1 mm long, ovate, persistent, almost glabrous. Receptacle urceolate, sessile, tomentellous on exterior, tomentose within. Calyx lobes acute, tomentellous on both surfaces. Petals absent. Stamens 5, unilateral, with fused sterile portion of ring opposite to them; filaments connate at base only, shorter than calyx lobes, pubescent. Ovary villous. Style pubescent throughout, equalling filaments. Fruit pyriform when young; epicarp with a waxy indumentum; pericarp thin, hard, tomentellous within.

Has as synonym

heterotypic *Licania duckei* Maguire

DESCRIPTION

Leaf: shape lanceolate/oblong lanceolate; **abaxial indumentum** lanate-pubescent; **petiole gland(s)** absent. **Inflorescence:** type panicle. **Flower:** **receptacle shape** campanulate; **pedicel** pedicellate; **stamen number** 3; **filament length** included; **filament fusion** free. **Fruit:** **epicarp** pulverulent.

ADDITIONAL DESCRIPTION

Trees to 20 m tall or shrubs. Branches glabrous when young, obscurely lenticellate. Leaves: stipules c. 1.5 mm long, linear, coriaceous, persistent, adnate to extreme base of petiole; petioles 3–6 mm long, glabrous, eglandular, shallowly canaliculate; lamina lanceolate to oblong-lanceolate, coriaceous, 3.5–8 × 1.3–3.5 cm, with a finely pointed acumen 10–15 mm long at apex, cuneate or subcuneate at base; upper surface glabrous; lower surface with short dense white persistent lanate pubescence; venation shallowly reticulate; midrib glabrous, more or less plane above; primary veins 8–15 pairs, prominulous beneath, plane above. Inflorescences terminal and axillary branched panicles; rachis and branches glabrous. Flowers c. 1.5 mm long, in cymules on long slender peduncles attached to primary inflorescence branches. Bracts and bracteoles minute, persistent, glabrous. Receptacle campanulate, glabrous on exterior, tomentellous within; pedicels 0.5–3 mm long. Calyx lobes acute, puberulous on both surfaces. Petals absent. Stamens 3, unilateral; filaments shorter than calyx lobes, glabrous, free to base. Ovary tomentose. Style rising to base of filaments, pubescent. Fruit to 1.8 mm long, pyriform; epicarp pulverulent, drying reddish; mesocarp thin; endocarp hard, thin, sparsely hirsutulous within.

Licania harlingii Prance

DESCRIPTION

Leaf: shape ovate elliptic; **abaxial indumentum** lanate-pubescent; **petiole gland(s)** absent. **Inflorescence:** type racemose panicle. **Flower:** receptacle shape globose; **pedicel** sessile; **stamen number** 5 - 6; **filament length** included; **filament fusion** free. **Fruit:** **epicarp** unknown.

ADDITIONAL DESCRIPTION

Trees to 6 m tall. Branches puberulous when young, soon becoming glabrous and lenticellate with age. Leaves: stipules small, c. 1 mm long, axillary, caducous; petioles 5-6 mm long, tomentellous, terete; lamina ovate-elliptic, chartaceous, 7-10 × 3-5 cm, subcuneate at base, with acumen 8-12 mm long, glabrous above, densely lanate-pubescent below with puberulous conspicuous venation; midrib slightly impressed above, prominent beneath; primary veins 8-11 pairs, plane above, impressed beneath. Inflorescences of terminal racemose panicles; rachis and branches yellow-brown, puberulous. Bracts and bracteoles small, triangular-hastate, persistent, tomentellous on exterior. Flowers c. 1.5 mm long, borne singly along primary branches of inflorescence. Receptacle globose, sessile, brown-tomentellous on exterior, lanate within. Calyx lobes acute, tomentellous on both surfaces. Petals absent. Stamens 5 or 6, slightly unilateral; filaments free, shorter than calyx lobes, glabrous. Ovary tomentellous. Style equalling filaments, glabrous or with a few hairs only. Fruit not seen.

Licania hebantha Mart. ex Hook.f.

DESCRIPTION

Leaf: shape elliptic/ovate orbicular; **abaxial indumentum** lanate-pubescent; **petiole gland(s)** absent. **Inflorescence:** type racemose panicle. **Flower:** receptacle shape campanulate; **pedicel** sessile; **stamen number** 5 - 6; **filament length** included; **filament fusion** free. **Fruit:** epicarp unknown.

ADDITIONAL DESCRIPTION

Shrubs or small trees. Branches puberulous when young, soon becoming glabrous and lenticellate. Leaves: stipules linear, 2-2.5 mm long, coriaceous, persistent, adnate to extreme base of petiole; petiole 1.5-3 mm long, terete, eglandular, tomentose; lamina ovate-orbicular or elliptic, submembranous, 2.5-9 × 2.2-5 cm, rounded to acute at apex, subcordate at base, glabrous above, with appressed lanate pubescence beneath obscuring the deeply reticulate venation; midrib slightly impressed above, hirsutulous towards base; primary veins 7-13 pairs, prominent beneath, plane or slightly impressed above. Inflorescences terminal and subterminal racemose panicles; rachis and branches tomentose. Flowers c. 3 mm long, sessile on primary branches of inflorescence. Bracts and bracteoles 0.5-1.5 mm long, elliptic, persistent, tomentose on exterior. Receptacle campanulate, sessile, tomentose on exterior, lanate-pilose within. Calyx lobes acute, tomentose on exterior, puberulous within. Petals absent. Stamens 5 or 6, unilateral; filaments shorter than calyx lobes, glabrous, free to base. Ovary pilose. Style equalling filaments, pubescent throughout. Fruit unknown.

Licania hoehnei Pilg.

DESCRIPTION

Leaf: shape oblong; **abaxial indumentum** lanate; **petiole gland(s)** absent. **Inflorescence:** type racemose panicle. **Flower:** receptacle **shape** campanulate; **pedicel** sessile; **stamen number** 5 - 7; **filament length** included; **filament fusion** free. **Fruit:** **epicarp** rufous pubescent.

ADDITIONAL DESCRIPTION

Tree or shrub. Branches puberulous when young, soon becoming glabrous and conspicuously lenticellate. Leaves with stipules 1-3 mm long, lanceolate, persistent, tomentellous; petioles 4-7 mm long, tomentose when young, soon becoming glabrous, terete, eglandular; lamina oblong, coriaceous, $3.7-8 \times 1.5-3$ cm, rounded to acuminate at apex but usually acute, subcuneate at base, glabrous above, persistently densely grey-lanate below; reticulations conspicuous but shallow; midrib plane or slightly impressed above, glabrous; primary veins 7-9 pairs, prominent beneath, conspicuous above. Inflorescences dense terminal and subterminal racemose panicles; rachis and branches tomentellous. Flowers c. 2 mm long, solitary or in small groups densely crowded on primary branches of inflorescence. Bracts and bracteoles 0.5-1 mm long, triangular, persistent, puberulous on exterior. Receptacle campanulate, sessile, tomentellous on exterior, tomentose within. Calyx lobes acute, puberulous on both surfaces. Petals absent. Stamens 5-7, unilateral; filaments shorter than calyx lobes, glabrous. Ovary tomentose. Style equalling filaments, pubescent throughout. Fruit globose to pyriform; epicarp densely rufous-pubescent; pericarp rather thick, hard, fibrous, lanate-hirsutulous within.

Licania hypoleuca Benth.

This treatment is composed of the following taxa: *Licania hypoleuca*, *Licania hypoleuca* var. *foveolata*, *Licania hypoleuca* var. *hypoleuca*.

DESCRIPTION

Leaf: shape oblong lanceolate/ovate; **abaxial indumentum** stomatal-cavity/lanate/pulverulent farinaceous; **petiole gland(s)** absent. **Inflorescence:** type panicle. **Flower:** receptacle shape campanulate; **pedicel** pedicellate; **stamen number** 3 - 5; **filament length** included; **filament fusion** free. **Fruit:** epicarp pulverulent.

ADDITIONAL DESCRIPTION

Trees to 35 m tall. Branches glabrous when young, lenticellate. Leaves: stipules 1-2 mm long, linear, coriaceous, persistent, adnate to extreme base of petiole; petioles 2-6 mm long, glabrous or pubescent, becoming glabrous with age, transversely rugose, eglandular, terete or canaliculate; lamina ovate to oblong-lanceolate, membranous to coriaceous, 2.5-10 (-11.5) × 0.8ñ4.5 (ñ5.5) cm, with a fine acumen 5-16 mm long at apex, rounded to cuneate but usually subcuneate at base; upper surface glabrous; lower surface short grey-pulverulent-farinaceous or sordid-lanate; venation shallowly reticulate; midrib plane to prominulous above, glabrous; primary veins 5-9 pairs, prominulous beneath, plane above. Inflorescences terminal and axillary branched panicles; rachis and branches sparsely puberulous. Flowers 1.5 mm long, on long slender peduncles attached to primary inflorescence branches. Bracts and bracteoles 0.2-0.5 mm long, persistent. Receptacle campanulate, grey-puberulous to tomentellous on exterior, tomentellous within; pedicels 0.25-1 mm long. Calyx lobes acute, puberulous on both surfaces. Petals absent. Stamens 3-5, unilateral; filaments shorter than calyx lobes, glabrous, free to base. Ovary lanate. Style sparsely hirsute throughout. Fruit pyriform to ovoid, usually less than 1.5 cm long, rarely 2 cm long; epicarp with sordid pulverulent indumentum; mesocarp thin; endocarp thin, hard, fibrous, hirsutulous within.

Licania impressa Prance

DESCRIPTION

Leaf: shape oblong/oblong lanceolate; **abaxial indumentum** stomatal-cavity/lanate/arachnoid; **petiole gland(s)** present.
Inflorescence: type panicle. **Flower:** receptacle shape campanulate; **pedicel** pedicellate; **stamen number** 6 - 7; **filament length** included; **filament fusion** free. **Fruit:** epicarp tomentose.

ADDITIONAL DESCRIPTION

Trees, medium to large sized. Branches puberulous when young, glabrescent. Leaves: stipules lanceolate, coriaceous, subpersistent, adnate to base of petiole; petioles 7-14 mm long, tomentose when young, canaliculate, usually with 2 glands; lamina oblong-lanceolate to oblong, coriaceous, $5.5-13 \times 1.8-4$ cm, acuminate at apex with acumen 3-7 mm long, rounded to subcuneate at base, glabrous above, lanate-arachnoid pubescent beneath, with deep reticulate venation or stomatal cavities beneath; midrib glabrous and impressed above; primary veins 9-12 pairs, plane and slightly impressed above, prominent beneath. Inflorescences of terminal and axillary panicles; rachis and branches grey-brown tomentose. Bracts and bracteoles small, ovate, persistent, tomentose on exterior. Flowers c. 1.5 cm long, borne in groups of 2-3 on short peduncles attached to primary branches of inflorescence. Receptacle campanulate, tomentose on exterior, tomentose within; pedicels c. 0.25 mm long. Calyx lobes acute, tomentose on both surfaces. Petals absent. Stamens 6 or 7, inserted around complete circle; filaments glabrous, free to base, shorter than calyx lobes. Ovary pilose. Style pubescent to apex, shorter than calyx lobes. Fruit pyriform; exocarp sordid-tomentose.

heterotypic *Licania leptostachya* var. *crassifolia* (Benth.) Benoist

DESCRIPTION

Leaf: shape oblong/ovate; **abaxial indumentum** lanate; **petiole gland(s)** absent. **Inflorescence:** type spike(s). **Flower:** receptacle shape campanulate; **pedicel** sessile; **stamen number** 5 - 7; **filament length** included; **filament fusion** free. **Fruit:** **epicarp** tomentulose.

ADDITIONAL DESCRIPTION

Shrub or rarely small tree. Branches tomentellous to puberulous when young, soon becoming glabrous and lenticellate. Leaves: stipules to 2 mm long, linear, persistent, pubescent, adnate to extreme base of petiole or axillary; petioles 2-5 mm long, terete, eglandular, tomentellous when young; lamina ovate to oblong, thick-coriaceous, $2.5\text{-}8.5 \times 1.3\text{-}4$ (-5.5) cm, acute to acuminate at apex with acumen to 10 mm long, usually rounded at base, rarely subcuneate, glabrous above, densely brown-lanate below (pubescence easily removed); midrib plane or slightly impressed above, glabrous; primary veins 7-9 pairs, prominulous beneath, plane above. Inflorescences terminal and axillary spikes, occasionally slightly branched; rachis tomentose when young. Flowers c. 2 mm long, in small glomerules along rachis. Bracts and bracteoles ovate to lanceolate, 1ñ3 mm long, persistent, tomentose on exterior. Receptacle campanulate, sessile, tomentose on exterior, tomentose within. Calyx lobes acute, tomentose on exterior, puberulous within. Petals absent. Stamens 5-7, slightly unilateral; filaments shorter than calyx lobes, glabrous. Ovary lanate. Style equalling filaments, tomentose throughout. Fruit globose, c. 1.6 cm diameter, including stipe c. 2 mm long; epicarp with short tomentellous pubescence; pericarp thin, hard, fibrous, tomentose-hirsute within.

Licania irwini Prance

DESCRIPTION

Leaf: shape elliptic/ovate orbicular; **abaxial indumentum** glabrous; **petiole gland(s)** absent. **Inflorescence:** type panicle. **Flower:** receptacle shape campanulate; **pedicel** sessile; **stamen number 5**; **filament length** included; **filament fusion** free. **Fruit:** epicarp pulverulent/rugose.

ADDITIONAL DESCRIPTION

Trees. Branches glabrous when young, lenticellate. Leaves: stipules small, thick, to 1.5 mm long, subpersistent, adnate to base of petiole; petioles 2-4 mm long, glabrous, eglandular, weakly canaliculate; lamina thickly coriaceous, ovate-orbicular to elliptic, 2-6.5 × 1.2-4 cm, rounded to obtusely-apiculate at apex, rounded at base with margins recurved, glabrous on both surfaces, glandular but not pustulate beneath; midrib glabrous and prominulous above; primary veins 6-12 pairs, plane above, prominulous beneath. Inflorescences terminal and subterminal panicles; rachis glabrescent with branches puberulous. Bracts and bracteoles triangular, to 1 mm long, persistent, puberulous outside. Flowers sessile, 2.5-3 mm long. Receptacle campanulate, sordid-tomentellous outside, tomentose within. Calyx lobes acute, tomentellous on both surfaces. Petals absent. Stamens 5, unilateral; filaments glabrous, free to base, shorter than calyx lobes. Ovary villous. Style pubescent to apex, shorter than calyx lobes. Fruit pyriform, 3.5 mm long; stipe 12 mm long; epicarp sordid-pulverulent, weakly rugose when dry; mesocarp thin, fleshy; endocarp hard, 2.5 mm thick, woody, sparsely pubescent within.

Licania kunthiana Hook.f.

Has as synonym

heterotypic *Licania hypargyrea* Malme

heterotypic *Licania parviflora* var. *submembranacea* Maguire

DESCRIPTION

Leaf: shape oblong lanceolate/oblong ovate; **abaxial indumentum** lanate farinaceous; **petiole gland(s)** absent. **Inflorescence:** type racemose panicle. **Flower:** receptacle shape campanulate; **pedicel** sessile; **stamen number** 5 - 6; **filament length** included; **filament fusion** free. **Fruit:** **epicarp** glabrous/pulverulent.

ADDITIONAL DESCRIPTION

Trees to 25 m tall. Branches puberulous when young, soon becoming glabrous and lenticellate. Leaves: stipules lanceolate, 2-3 mm long, persistent, adnate to extreme base of petiole; petioles 2-5 mm long, tomentellous to puberulous, becoming glabrous with age, shallowly canaliculate to terete, eglandular; lamina oblong-ovate to oblong-lanceolate, membranous to subcoriaceous, 3-8.5 × 1.3-5 cm, acuminate at apex with acumen 2-13 mm long, rounded to cuneate at base, glabrous above, densely lanate-farinaceous beneath; upper surface of midrib plane or slightly impressed, glabrous except at extreme base; primary veins 7-9 pairs, prominent beneath, plane above; secondary veins reticulate. Inflorescences terminal and axillary racemose panicles; rachis and branches sparsely puberulous. Flowers 1.5-2 mm long, sessile and densely crowded on primary branches of inflorescence. Bracts and bracteoles 0.2-0.8 mm long, triangular. Receptacle campanulate, sessile, sparsely grey-puberulous or rarely tomentellous on exterior, tomentose within. Calyx lobes acute, puberulous on both surfaces. Petals absent. Stamens 5 or 6, unilateral; filaments shorter than calyx lobes, glabrous. Ovary lanate. Style lanate, equalling filaments. Fruit oblong-elliptical, up to 2 cm long, 1 cm broad, with a tapered base; epicarp yellow-brown-pulverulent, sometimes becoming glabrous with age; pericarp thin, hard, fibrous, hirsutulous within.

Licania lamentanda Prance

DESCRIPTION

Leaf: shape oblong-elliptic; **abaxial indumentum** lanate appressed; **petiole gland(s)** absent. **Inflorescence:** type racemose panicle. **Flower:** receptacle shape campanulate; **pedicel** subsessile; **stamen number** 6 - 7; **filament length** included; **filament fusion** free. **Fruit:** epicarp tomentulose/velutinous.

ADDITIONAL DESCRIPTION

Trees. Branches shortly tomentellous when young, becoming glabrous with age. Leaves: stipules caducous (not seen); petioles 1.1-1.5 cm long, velutinous-tomentellous, terete or weakly canaliculate above, eglandular; lamina oblong-elliptic, coriaceous, 12-16.5 × 6-8.5 cm, subcuneate to rounded at base, rounded to apiculate at apex, glabrous above, with a short appressed-lanate brown pubescence beneath; midrib prominulous above, prominent beneath; primary veins 10-12 pairs, prominulous above, prominent beneath, secondary venation prominulous, c. more or less parallel at 90° to primary veins. Inflorescences of racemose panicles, 10-14 cm long; rachis and branches shortly tomentellous. Bracts and bracteoles membranous, persistent, ovate, 1.5-3 mm long, tomentellous on exterior, puberulous within. Flowers 4.5-5.5 mm long. Receptacle campanulate, 3.5 mm long, tomentellous on exterior, tomentose within, subsessile. Calyx lobes 5, acute, triangular, c. 1.5 mm long, tomentellous on both surfaces. Petals absent. Stamens 6 or 7, shorter than calyx lobes, inserted around 3/4 of a circle. Ovary extremely densely tomentose, thick-walled. Style pubescent on lower portion, glabrous above. Fruit ellipsoid, 5-6.5 cm long, 4-4.5 cm broad; exocarp densely velutinous tomentellous; pericarp hard, woody, c. 6 mm thick, lanate within.

Licania lanceolata Prance

DESCRIPTION

Leaf: shape lanceolate; **abaxial indumentum** stomatal-cavity/lanate-pubescent; **petiole gland(s)** absent. **Inflorescence:** type panicle/spike(s). **Flower:** receptacle shape campanulate; **pedicel** sessile; **stamen number** 6 - 8; **filament length** included; **filament fusion** free. **Fruit:** epicarp pubescent.

ADDITIONAL DESCRIPTION

Shrub or suffrutex. Branches tomentellous when young, soon becoming glabrous. Leaves with stipules minute, to 1 mm long, linear, puberulous, subpersistent, extrapetiolar; petioles 2-10 mm long, terete, eglandular, tomentose when young; lamina lanceolate, tapering to base, thickly coriaceous, 3.5-6 × 1-2.5 cm, glabrous above, densely lanate pubescent and deeply reticulate or with stomatal cavities beneath; apex acute; base rounded; primary veins 7-10 pairs, prominent beneath, plane above, arcuate and confluent before reaching margin. Flowers c. 2 mm long. Inflorescence of little-branched terminal and axillary panicles and axillary spikes; rachis and branches brown-tomentellous. Bracts and bracteoles 0.3-1 mm long, ovate, persistent, puberulous on exterior. Receptacle campanulate, sessile, tomentose on exterior, lanate within. Calyx lobes acute, tomentellous on both surfaces. Petals absent. Stamens 6-8, inserted around complete circle; filaments glabrous, free to base, shorter than calyx lobes. Ovary and style villous. Fruit oblong; exocarp sordid-pubescent; pericarp thin, fibrous, fragile, hirsutulous within.

DESCRIPTION

Leaf: shape elliptic/ovate; **abaxial indumentum** lanate; **petiole gland(s)** absent/present. **Inflorescence:** type racemose panicle. **Flower:** receptacle shape campanulate; **pedicel** sessile; **stamen number** 6 - 8; **filament length** included; **filament fusion** free. **Fruit:** epicarp rufous velutinous.

ADDITIONAL DESCRIPTION

Tree to 30 m tall. Branches puberulous or rufous-hirsutulous when young, becoming glabrous with age. Leaves with stipules elliptic to lanceolate, 2-5 mm long, pubescent, intrapetiolar, subpersistent; petioles 4ñ8 mm long, densely rufous-tomentose, terete, eglandular or with medial glands; lamina ovate to elliptic, coriaceous, 5-22 × 2.5-9 cm, acuminate or rarely acute at apex with acumen 2-10 mm long, rounded at base, glabrous above; lower surface with deeply reticulate often hirsutulous venation with the area between veins lanate; midrib slightly impressed above, tomentellous towards base; primary veins 7-10 pairs, prominent beneath, impressed and glabrous; secondary veins ±parallel. Inflorescences terminal and subterminal racemose panicles; rachis and branches rufous-tomentose. Flowers 2.5-3 mm long, sessile on primary branches of inflorescence. Bracts and bracteoles ovate, to 3 mm long, persistent, tomentose on exterior. Receptacle campanulate, sessile, tomentose on exterior and within. Calyx lobes acute, tomentose on both surfaces. Petals absent. Stamens 6-8, inserted in a complete circle; filaments shorter than calyx lobes, glabrous, free to base. Ovary villous. Style equaling filaments, villous throughout. Fruit round to pyriform, to 10 cm long including the short stipe to 10 mm long; epicarp rufous-velutinous; mesocarp thin, fleshy; endocarp thick, hard, sparsely hirsutulous within.

DESCRIPTION

Leaf: shape oblong lanceolate/ovate/oblong ovate; **abaxial indumentum** lanate; **petiole gland(s)** absent. **Inflorescence:** type spike(s). **Flower:** **receptacle shape** campanulate/cupuliform; **pedicel** sessile; **stamen number** 6 - 7; **filament length** included; **filament fusion** free. **Fruit:** **epicarp** tomentose.

ADDITIONAL DESCRIPTION

Shrub or small tree. Branches puberulous to glabrescent when young, soon becoming glabrous and conspicuously lenticellate. Leaves with stipules linear, to 3 mm long, pubescent, persistent, axillary; petioles 2-4 mm long, terete, eglandular, tomentose when young; lamina ovate, membranous, oblong-ovate to oblong-lanceolate, 3-7 × 1.5-3.5 cm, usually with a finely pointed acumen 2-15 mm long, cuneate to rounded at base, glabrous above, densely brown-lanate below (pubescence easily removed); midrib plane above, pubescent towards base; primary veins 7-10 pairs, prominent beneath, plane above. Inflorescences unbranched spikes or glomerules, predominantly axillary; rachis tomentose when young, becoming glabrescent in fruit. Flowers c. 2 mm long, in dense glomerules on rachis. Bracts and bracteoles 0.5-1.5 mm long, triangular, persistent, puberulous on exterior. Receptacle cupuliform-campanulate, sessile, tomentose on exterior and within. Calyx lobes acute, tomentose on exterior, puberulous within. Petals absent. Stamens 6 or 7, inserted in a complete circle; filaments shorter than calyx lobes, glabrous. Ovary tomentose. Style equaling filaments, tomentose at base, glabrous above. Fruit oblong, c. 2.5 cm long, including stipe c. 6 mm long; epicarp short-tomentose; pericarp thin, hard, fibrous, densely hirsutulous-tomentose within.

Licania littoralis Warm.

This treatment is composed of the following taxa: *Licania littoralis*, *Licania littoralis* var. *cuneata*, *Licania littoralis* var. *littoralis*.

DESCRIPTION

Leaf: shape obovate/ovate elliptic; **abaxial indumentum** glabrous; **petiole gland(s)** absent. **Inflorescence:** type racemose panicle. **Flower:** receptacle shape campanulate; **pedicel** sessile; **stamen number** 4; **filament length** included; **filament fusion** free. **Fruit:** **epicarp** smooth/waxy.

ADDITIONAL DESCRIPTION

Trees or shrubs. Branches puberulous when young, becoming glabrous and lenticellate with age. Leaves: stipules lanceolate, 1 mm long, adnate to petiole base, subpersistent; petioles 2-3 mm long, glabrous, rugose, terete, eglandular; lamina obovate to ovate-elliptic, thick-coriaceous, 3-11 × 1.2-6.5 cm, retuse to obtuse at apex, rounded to cordate or rarely cuneate at base, glabrous on both surfaces; palisade glands occasional; midrib prominulous above, glabrous; primary veins 7-9 pairs, prominent beneath, almost plane above. Inflorescences terminal and subterminal racemose panicles; rachis and branches puberulous. Flowers c. 3 mm long, solitary or in small groups on primary branches of inflorescence. Bracts and bracteoles 0.5-1 mm long, persistent, ovate, entire, tomentellous on exterior. Receptacle campanulate, sessile, tomentellous on exterior, tomentose within. Calyx lobes acute, tomentellous on both surfaces. Petals absent. Stamens 4, unilateral; filaments shorter than calyx lobes, free to base, glabrous. Ovary short-tomentose. Style pubescent throughout, equalling filaments. Fruit pyriform, to 3 cm long; epicarp smooth with a waxy indumentum; pericarp thin, hard, fibrous, tomentose within.

Has as synonym

heterotypic *Licania hostmannii* Fritsch

DESCRIPTION

Leaf: shape elliptic/oblong ovate; **abaxial indumentum** stomatal-cavity/lanate; **petiole gland(s)** present. **Inflorescence:** type racemose panicle. **Flower:** receptacle shape conical; **pedicel** sessile; **stamen number** 8 - 11; **filament length** equal; **filament fusion** fused basally. **Fruit:** **epicarp** velutinous pubescent.

ADDITIONAL DESCRIPTION

Trees to 22 m tall. Branches tomentose when young, becoming glabrous with age. Leaves: stipules linear-lanceolate, 3-8 mm long, adnate to base of petioles, persistent; petioles 8-13 mm long, lanate, usually deeply canaliculate, with 2 or more pairs of sessile medial glands; lamina elliptic to oblong-ovate, coriaceous, 7.5-18 × 2.8-9 cm, cuspidate to acuminate at apex with acumen 2-12 mm long, rounded at base, glabrous above; venation deeply reticulate on lower surface, revealing open stomatal cavities or deep reticulations, lanate between the venation or in the mouth of the cavities; midrib slightly impressed above for entire length; primary veins 8-10 pairs, prominent beneath, slightly impressed above. Inflorescences terminal and axillary racemose panicles; rachis and branches tomentose. Flowers 4-5 mm long, solitary or in small groups, sessile on primary and secondary branches of inflorescence. Bracts and bracteoles 1-3.5 mm long, oblong to lanceolate, persistent, entire, eglandular, tomentose on exterior. Receptacle conical, sessile, tomentose on exterior, villous-tomentose within. Calyx lobes acute, tomentose on both surfaces. Petals absent. Stamens 8-11, inserted in a complete circle; filaments equalling calyx lobes, slightly connate at base, glabrous except for deflexed hairs at base. Ovary pilose. Style equalling filaments, lanate throughout. Fruit globose when mature, 5-6 cm diameter, with short stipe, pyriform when young; epicarp velutinous-pubescent; pericarp thick, undifferentiated, fibrous, densely pubescent within.

DESCRIPTION

Leaf: shape oblong-elliptic; **abaxial indumentum** glabrous; **petiole gland(s)** absent. **Inflorescence:** type panicle. **Flower:** receptacle **shape** campanulate; **pedicel** sessile; **stamen number** 5; **filament length** included; **filament fusion** free. **Fruit:** **epicarp** unknown.

ADDITIONAL DESCRIPTION

Tree to 15 m tall. Branches glabrous when young, lenticellate. Leaves with stipules acute, c. 0.75 mm long, persistent, sparsely puberulous, adnate to base of petiole; petioles 2-3 mm long, glabrous, rugulose, eglandular; lamina oblong-elliptic, coriaceous, 5.5-9.5 × 3-4.7 cm, cuneate at base, acute at apex, glabrous on both surfaces; midrib plane above, prominulous beneath; primary veins 7-11 pairs, plane or prominulous above, prominulous beneath. Inflorescences of terminal and subterminal branched panicles; rachis sparsely puberulous, becoming glabrous with age; branches puberulous. Bracts and bracteoles c. 0.5 mm long, persistent, triangular, puberulous on exterior. Flowers 2-2.5 mm long. Receptacle campanulate, sessile, sordid-tomentellous on exterior, tomentose within. Calyx lobes 5, acute, tomentellous on exterior, puberulous within. Petals absent. Stamens 5, unilateral, inserted opposite to 3 sepals; filaments glabrous, shorter than calyx lobes. Ovary pilose. Style glabrous. Fruit unknown.

Licania maxima Prance

DESCRIPTION

Leaf: shape oblong; **abaxial indumentum** lanate/arachnoid; **petiole gland(s)** absent. **Inflorescence:** type racemose panicle. **Flower:** receptacle shape campanulate; **pedicel** sessile; **stamen number 5**; **filament length** included; **filament fusion** free. **Fruit:** **epicarp** unknown.

ADDITIONAL DESCRIPTION

Tree to 32 m tall. Branches glabrescent when young, lenticellate. Leaves with stipules lanceolate, 4-5 mm long, persistent, adnate to base of petiole; petioles 6-7 mm long, terete to weakly canaliculate, pubescent when young, eglandular; lamina submembranous, oblong, 6.5-10.5 × 2.5-4.7 cm, with acumen 4-8 mm long, rounded to subcuneate at base, glabrous above, lanate-arachnoid pubescent beneath, deeply reticulate; midrib glabrous and plane above; primary veins 8-10 pairs, plane above, prominent beneath. Inflorescences terminal and subterminal racemose panicles; rachis and branches grey-puberulous; bracts and bracteoles ovate to lanceolate, to 2 mm long, equalling flowers in length, persistent, puberulous outside. Flowers sessile, 2 mm long. Receptacle campanulate, grey-tomentellous outside, tomentose within. Calyx lobes acute, tomentellous on both surfaces. Petals absent. Stamens 5, inserted around complete circle; filaments glabrous, free to base, shorter than calyx lobes. Ovary villous-tomentose. Style pubescent to apex, shorter than calyx lobes. Fruit not seen.

Licania membranacea Sagot ex Laness.

Has as synonym

homotype *Licania galibica* Benoist

DESCRIPTION

Leaf: shape oblong; **abaxial indumentum** lanate/arachnoid; **petiole gland(s)** absent. **Inflorescence:** type panicle. **Flower:** receptacle shape campanulate; **pedicel** pedicellate; **stamen number** 3 - 5; **filament length** included; **filament fusion** free. **Fruit:** **epicarp** tomentose/rufous.

ADDITIONAL DESCRIPTION

Trees to 32 m tall. Branches puberulous when young, becoming glabrous and lenticellate with age. Leaves: stipules 3-7 mm long, linear, coriaceous, persistent, adnate to extreme base of petiole; petioles 8-12 mm long, glabrous or glabrescent, eglandular, canaliculate, transversely rugose; lamina oblong, coriaceous, 8-19 × 3.7-7.8 cm, with fine acumen 10-25 mm long at apex, rounded to subcuneate at base; upper surface glabrous; lower surface with short appressed lanate-arachnoid pubescence; venation shallow; midrib plane or prominulous above, glabrous; primary veins 7-10 pairs, prominent beneath, plane above. Inflorescences terminal and axillary panicles; rachis and branches puberulous. Flowers c. 1.5 mm long, in cymules on long slender peduncles attached to primary branches of inflorescence. Bracts and bracteoles 0.5-1 mm long, persistent, puberulous. Receptacle campanulate, tomentellous on exterior, tomentellous within; pedicels 0.25-1 mm long. Calyx lobes acute, tomentellous on both surfaces. Petals absent. Stamens 3-5, unilateral; filaments shorter than calyx lobes, glabrous, free to base. Ovary tomentose. Style equalling filaments, lanate. Fruit pyriform, c. 2.5 cm long; epicarp brown rufous tomentose; mesocarp thin, fleshy; endocarp hard, thin, woody, hirsutulous within.

Licania micrantha Miq.

This treatment is composed of the following taxa: *Licania micrantha*, *Licania micrantha* subsp. *micrantha*.

DESCRIPTION

Leaf: shape oblong/ovate elliptic; **abaxial indumentum** lanate; **petiole gland(s)** absent. **Inflorescence:** type racemose panicle. **Flower:** receptacle shape campanulate; **pedicel** sessile; **stamen number** 3; **filament length** included; **filament fusion** free. **Fruit:** epicarp waxy/pulverulent.

ADDITIONAL DESCRIPTION

Trees to 30 m tall. Branches puberulous when young, soon becoming glabrous and lenticellate. Leaves: stipules lanceolate to 7 mm long, glabrous, persistent, adnate to extreme base of petiole or axillary; petioles 4-12 mm long, puberulous when young, soon becoming glabrous, terete, eglandular; lamina ovate-elliptic to oblong, thick-coriaceous, 4.5-15 × 2.3-8 cm, usually acuminate or caudate at apex, rarely acute with acumen 2-14 mm long, rounded at base, glabrous above; margins plane; lower surface with dense brown lanate pubescence which is easily rubbed off; midrib more or less plane above, glabrous; primary veins 5-7 pairs, prominent beneath, plane above. Inflorescences terminal and axillary much-branched racemose panicles; rachis and branches tomentellous to puberulous. Flowers c. 2 mm long, sessile on primary branches of inflorescence. Bracts and bracteoles 0.5-1 mm long, ovate, persistent, exterior puberulous. Receptacle campanulate, sessile, tomentellous on exterior, tomentose within. Calyx lobes acute, puberulous on both surfaces. Petals absent. Stamens 3, unilateral; filaments shorter than calyx lobes, glabrous. Ovary pilose. Style equalling filaments, pubescent throughout. Fruit pyriform, to 5 cm long, including stipe 5-10 mm long; epicarp with waxy pulverulent indumentum, wrinkled when dry; pericarp thin, hard, fibrous, densely hirsutulous within.

Licania mollis Benth.

Has as synonym

heterotypic *Licania lucida* J.F.Macbr.

DESCRIPTION

Leaf: shape oblong/ovate elliptic; **abaxial indumentum** lanate; **petiole gland(s)** absent. **Inflorescence:** type racemose panicle. **Flower:** receptacle shape campanulate; **pedicel** sessile; **stamen number** 8 - 11; **filament length** included; **filament fusion** fused basally. **Fruit:** epicarp velutinous.

ADDITIONAL DESCRIPTION

Tree to 15 m tall. Branches pubescent when young, becoming glabrous and lenticellate with age. Leaves with stipules linear-lanceolate, 3-6 mm long, erect, adnate to base of petiole, persistent; petioles 3-6 mm long, tomentose, terete, eglandular; lamina ovate-elliptic to oblong, coriaceous, 5-13 × 2.3-7 cm, cuspidate to acuminate at apex with acumen 3-18 mm long, rounded to subcordate at base, glabrous and shining above, with lower surface deeply reticulate-venose and densely lanate; midrib impressed for most of length above, becoming prominulous near base, tomentose; primary veins 9-12 pairs, prominent beneath, plane or nearly so above. Inflorescences terminal and axillary racemose panicles, densely brown-tomentose. Flowers 3-3.5 mm long, sessile and crowded on primary branches of inflorescence. Bracts and bracteoles 1-3.5 mm long, oblong-lanceolate, persistent entire, eglandular, tomentose on exterior. Receptacle broadly campanulate, sessile, tomentose on exterior, tomentellous within. Calyx lobes acute, tomentose on exterior, puberulous within. Petals absent. Stamens 8-11, inserted in an arc of c. 270°; filaments shorter than calyx lobes, connate at base. Ovary villous. Style equalling filaments, lanate throughout. Fruit globose but surface more or less longitudinally much-ridged, to 2.5 cm in diameter; epicarp ferruginous-velutinous; pericarp thick, hard, glabrous within.

Licania naviculistipula Prance

DESCRIPTION

Leaf: shape oblong-elliptic; **abaxial indumentum** stomatal-cavity; **petiole gland(s)** present. **Inflorescence:** type racemose panicle. **Flower:** receptacle shape campanulate; **pedicel** sessile; **stamen number** 8; **filament length** included; **filament fusion** free. **Fruit:** **epicarp** unknown.

ADDITIONAL DESCRIPTION

Tree c. 10 m tall. Branches tomentose when young, glabrescent. Leaves with stipules to 13 mm long, triangular, navicular, persistent, coriaceous, adnate to base of petiole; petioles 8-12 mm long, tomentose soon becoming glabrous, terete, with 2 sessile glands near to lamina base; lamina oblong-elliptic, coriaceous, 10-18 × 5.5-9 cm, acuminate at apex with acumen 2-10 mm long, glabrous above, with stomatal cavities filled with lanate pubescence beneath; midrib plane and glabrous above; primary veins 12-16 pairs, plane above, prominent and glabrescent beneath. Inflorescences of terminal and subterminal racemose panicles; rachis and branches ferrugineous-tomentose. Bracts to 10 mm long, tomentose, persistent; bracteoles 1-3 mm long, oblong, tomentose, persistent. Flowers 6-7.5 mm long. Receptacle narrowly-campanulate, sessile, brown-tomentose on exterior, tomentose within. Calyx lobes acute, tomentose on both surfaces. Petals absent. Stamens 8, unilateral with toothed staminodes opposite; filaments free, glabrous, shorter than calyx lobes. Ovary pilose. Style lanate-pubescent, equalling calyx lobes. Fruit not seen.

Licania nelsonii Prance

DESCRIPTION

Leaf: shape oblong-elliptic; **abaxial indumentum** lanate-pubescent; **petiole gland(s)** absent. **Inflorescence:** type spike(s).

Flower: receptacle shape campanulate; **pedicel** sessile; **stamen number** 5; **filament length** included; **filament fusion** free.

Fruit: epicarp unknown.

ADDITIONAL DESCRIPTION

Tree to 30 m tall. Branches brown-tomentose when young. Leaves with stipules adnate to base of petioles, linear, persistent, to 3 mm long; petioles 1-2 mm long, terete, eglandular, tomentose when young; lamina oblong-elliptic, chartaceous to coriaceous, 3-6.5 × 1.8-3.2 cm, acuminate at apex with acumen 1-3 mm long, rounded to slightly subcordate at base, densely white-lanate pubescent beneath; midrib slightly impressed above, prominent beneath; primary veins 5-7 pairs, plane to lightly impressed above, prominent beneath; venation conspicuously reticulate beneath in mature leaves. Inflorescences of terminal and axillary densely crowded spikes, 1-4.5 cm long; rachis densely tomentose. Bracts and bracteoles ovate, persistent, rufous-pubescent, c. 1 mm long. Flowers c. 2 mm long, sessile and densely clustered along inflorescence rachis. Receptacle campanulate, sessile, rufous tomentose on exterior, tomentose within. Calyx lobes 5, acute, cream when fresh, rufous-tomentose on exterior when dry, pale brown-tomentose on interior. Petals absent. Stamens 5, inserted opposite 3 calyx lobes; filaments shorter than calyx lobes, free, glabrous. Ovary densely pilose. Fruit unknown.

Licania niloi Prance

DESCRIPTION

Leaf: shape oblong-elliptic; **abaxial indumentum** waxy/pulverulent farinaceous; **petiole gland(s)** present. **Inflorescence:** type panicle. **Flower:** receptacle shape urceolate; pedicel sessile; **stamen number 3**; **filament length** included; **filament fusion** free. **Fruit:** epicarp unknown.

ADDITIONAL DESCRIPTION

Tree, medium sized. Branches glabrous when young, not lenticellate. Leaves with stipules 2 mm long, lanceolate, coriaceous, persistent, adnate to base of petiole; petioles 3-5 mm long, glabrous, terete, with 2 sessile glands; lamina oblong-elliptic, coriaceous, 4.5-9 × 2-4.2 cm, acute at apex, rounded to subcuneate at base, glabrous above, with waxy pulverulent-farinaceous pubescence beneath; midrib glabrous and plane above; primary veins 5-7 pairs, prominent beneath, plane above. Inflorescences of short terminal and axillary panicles; rachis and branches tomentellous. Bracts and bracteoles 0.5-3 mm long, ovate, persistent, puberulous on exterior. Flowers 3-4 mm long, not in cymules. Receptacle narrowly urceolate with swollen base, sessile, tomentellous on exterior, puberulous within. Calyx lobes lanceolate, puberulous on both surfaces. Petals absent. Stamens 3, unilateral; filaments glabrous, free to base, shorter than calyx lobes. Ovary shortly pubescent. Style puberulous to apex, shorter than calyx lobes. Fruit not seen.

Licania nitida Hook.f.

Has as synonym

basionym *Licania coriacea* var. *nitida* (Hook.f.) Fritsch

DESCRIPTION

Leaf: shape oblong-elliptic/oblong; **abaxial indumentum** lanate; **petiole gland(s)** absent. **Inflorescence:** type racemose panicle. **Flower:** receptacle shape urceolate; **pedicel** sessile; **stamen number** 3/4; **filament length** included; **filament fusion** free. **Fruit:** **epicarp** pulverulent.

ADDITIONAL DESCRIPTION

Shrub or low tree. Branches glabrous when young, conspicuously lenticellate. Leaves with stipules linear, c. 3 mm long, glabrous, persistent, adnate to extreme base of petiole; petioles 4-7 mm long, glabrescent or glabrous, terete to flattened, eglandular; lamina oblong to oblong-elliptic, thick-coriaceous, 4.5-10.5 × 2-5.5 cm, acute to bluntly acuminate at apex with acumen to 10 mm long, rounded to subcuneate at base, glabrous above, densely lanate beneath; midrib plane above, glabrous; primary veins 6-8 pairs, prominent beneath, prominulous above. Inflorescences terminal racemose panicles; rachis and branches tomentellous. Flowers 4-5 mm long, on primary branches of inflorescence. Bracts and bracteoles 0.8-1.5 mm long, linear, persistent, tomentellous on exterior. Receptacle urceolate, sessile, tomentellous on exterior, tomentose within. Calyx lobes acute, tomentellous on exterior, puberulous within. Petals absent. Stamens 3 (or 4), unilateral; filaments shorter than calyx lobes, glabrous. Ovary pilose. Style equalling filaments, pilose. Fruit pyriform, c. 3 cm long, on stipe c. 8 mm long; epicarp sordid-pulverulent; pericarp thin, hard, fibrous, tomentose within.

Licania orbicularis Spruce ex Hook.f.

DESCRIPTION

Leaf: shape elliptic/orbicular; **abaxial indumentum** waxy/pulverulent farinaceous; **petiole gland(s)** present. **Inflorescence:** type racemose panicle. **Flower:** **receptacle shape** urceolate; **pedicel** sessile; **stamen number** 2 - 4; **filament length** included; **filament fusion** free. **Fruit:** **epicarp** glabrous.

ADDITIONAL DESCRIPTION

Trees. Branches puberulous when young, becoming glabrous and lenticellate with age. Leaves: stipules 1-4 mm long, deltoid, coriaceous, adnate to base of petiole, subsessile; petioles 2-5 mm long, puberulous, becoming glabrescent with age, terete, with 2 rather obscure glands at lamina base; lamina predominantly orbicular but occasionally elliptic, thick-coriaceous, 3-10 × 1.8-7 cm, retuse rounded or acute at apex, rounded to subcuneate at base; margins revolute; upper surface glabrous; lower surface waxy grey pulverulent farinaceous pubescent; midrib glabrous and plane above; primary veins 7-11 pairs, prominent beneath, prominulous above. Inflorescences terminal and axillary little-branched racemose panicles, 6-10 cm long; rachis and branches tomentellous. Bracts and bracteoles lanceolate, c. 2 mm long, in small groups on primary branches of inflorescence. Receptacle urceolate, sessile, light brown tomentose on exterior, sparsely puberulous within. Calyx lobes acute, tomentellous on both surfaces. Petals absent. Stamens 2-4, unilateral; filaments shorter than calyx lobes, glabrous. Ovary pubescent. Style rising to base of filaments, pubescent. Fruit pyriform, c. 4 cm long, 2-2.5 cm broad; epicarp glabrous, drying yellow and wrinkled; mesocarp very thin; endocarp hard to 3 mm thick, granular and fibrous, velutinous within.

Licania ovalifolia Kleinhoonte

Has as synonym

heterotypic *Licania stahelii* Kleinhoonte

DESCRIPTION

Leaf: shape elliptic/ovate; **abaxial indumentum** rufous lanate; **petiole gland(s)** absent. **Inflorescence:** type racemose panicle. **Flower:** receptacle shape urceolate; **pedicel** sessile; **stamen number** 3; **filament length** included; **filament fusion** free. **Fruit:** **epicarp** pubescent.

ADDITIONAL DESCRIPTION

Trees. Branches puberulous when young, soon becoming glabrous and conspicuously lenticellate. Leaves: stipules lanceolate, 4-6 mm long, persistent, pubescent when young, adnate to lower portion of petiole; petioles 4-7 mm long, tomentellous when young, usually eglandular, terete; lamina oval to elliptic, thick-coriaceous, 3.5-10 × 2-6 cm usually rounded at apex but frequently acute, rounded at base, glabrous above; margins often recurved; lower surface densely rufous-lanate; midrib slightly impressed above, glabrous; primary veins 5-7 pairs, prominulous beneath, plane or slightly impressed above. Inflorescences terminal and axillary racemose panicles; rachis and branches rufous-tomentellous. Flowers 3-4 mm long, sessile on primary branches of inflorescence. Bracts and bracteoles 1.5-2.5 mm long, ovate, persistent, exterior tomentellous. Receptacle urceolate, sessile, tomentose on exterior and within. Calyx lobes acute, tomentellous on exterior, puberulous within. Petals absent. Stamens 3, unilateral; filaments shorter than calyx lobes, glabrous. Ovary pilose. Style equalling filaments, pubescent throughout. Fruit ellipsoid, 2.4-2.7 × 1.4-1.6 cm; exocarp yellow-brown pubescent.

ADDITIONAL DESCRIPTION

Trees to 30 m tall. Branches glabrous and lenticellate when young. Leaves: stipules 2-3 mm long, linear, coriaceous, subpersistent, adnate to extreme base of petiole; petioles 5-7 mm long, glabrescent, eglandular, rugose, usually shallowly canaliculate; lamina oblong-elliptic, coriaceous, 5-13 × 2-6.5 cm, with a finely pointed acumen 6-15 mm long at apex, rounded-subcuneate at base; upper surface glabrous; lower surface with well developed stomatal cavities filled with lanate pubescence; reticulation on lower surface glabrescent and cavities conspicuous; midrib plane above, or slightly impressed toward base, glabrous; primary veins 7-10 pairs, prominent below, more or less plane above. Inflorescences terminal and axillary branched panicles; rachis and branches slender, puberulous. Flowers 1.5-2 mm long, usually on long slender peduncles attached to primary branches of inflorescence, rarely almost sessile on branches of inflorescence. Bracts and bracteoles persistent, 0.2-1 mm long, puberulous. Receptacle campanulate, tomentellous on exterior, tomentellous to puberulous within; pedicels c. 0.25 mm long. Calyx lobes acute, puberulous on both surfaces. Petals absent. Stamens 3-5, unilateral; filaments shorter than calyx lobes, glabrous, free to base. Ovary tomentose. Style equaling filaments, sparsely pubescent throughout. Fruit oblong; epicarp with short sordid reddish-brown pulverulent pubescence; pericarp thin, hard, fibrous, sparsely hirsutulous within.

Licania paraensis Prance

DESCRIPTION

Leaf: shape elliptic; **abaxial indumentum** pubescent; **petiole gland(s)** absent/present. **Inflorescence:** type racemose panicle. **Flower:** receptacle shape campanulate/cupuliform; **pedicel** sessile; **stamen number** 6; **filament length** included; **filament fusion** free. **Fruit:** epicarp rufous velutinous.

ADDITIONAL DESCRIPTION

Trees. Branches puberulous when young, glabrescent. Leaves: stipules lanceolate, puberulous, 5-10 mm long, adnate to petiole; petioles 8-15 mm long, tomentellous, canaliculate, glandular or eglandular; lamina elliptic, chartaceous, 9-22 × 5.5-10 cm, rounded or mucronate at apex, rounded to subcuneate at base, glabrous above, deeply reticulate and with grey-lanate pubescence beneath; venation parallel; midrib impressed and glabrous above; primary veins 10-12 pairs, prominent beneath, plane above. Inflorescences of terminal and subterminal racemose panicles; rachis puberulous and branches ferrugineous-tomentellous. Bracts and bracteoles 0.3-2 mm long, lanceolate, subpersistent, puberulous on exterior. Flowers 2.5-3 mm long. Receptacle campanulate-cupuliform, sessile, ferrugineous-tomentellous on exterior, tomentose within. Calyx lobes acute, tomentellous on exterior, puberulous within. Petals absent. Stamens 6, inserted around complete circle; filaments glabrous, free to base, shorter than calyx lobes. Ovary pilose. Style pilose to apex. Young fruit rufous-velutinous pubescent.

Licania parviflora Benth.

This treatment is composed of the following taxa: *Licania parviflora*, .

DESCRIPTION

Leaf: shape oblong lanceolate/oblong ovate; **abaxial indumentum** stomatal-cavity/lanate tomentose; **petiole gland(s)** absent. **Inflorescence:** type racemose panicle. **Flower:** receptacle shape campanulate; **pedicel** sessile; **stamen number** 5 - 6; **filament length** included; **filament fusion** free. **Fruit:** epicarp pulverulent/velutinous pubescent.

ADDITIONAL DESCRIPTION

Trees to 25 m tall. Branches glabrous and conspicuously lenticellate when young. Leaves: stipules linear, to 4 mm long, glabrous, persistent, adnate to extreme base of petiole; petioles 4-6 mm long, terete, eglandular, puberulous, soon becoming glabrous; lamina oblong-ovate to oblong-lanceolate, coriaceous to submembranous, $4.5-12.5 \times 2-5.5$ cm, with a finely pointed acumens 5-20 mm long at apex, often subfalcate, rounded to subcuneate at base, glabrous above; lower surface with well developed stomatal cavities filled with lanate pubescence, or smooth and lanate-tomentose without stomatal cavities; reticulation glabrous and conspicuous; midrib plane above, glabrous; primary veins 7-11 pairs, prominent beneath, plane above. Inflorescences racemose panicles with puberulous to glabrescent rachis and tomentellous to glabrescent branches. Flowers c. 2 mm long, on primary branches of inflorescence. Bracts and bracteoles 0.2-0.5 mm long, triangular, subpersistent, puberulous on exterior. Receptacle campanulate, sessile, grey-tomentellous on exterior, tomentose within. Calyx lobes acute, tomentellous on exterior, puberulous within. Petals absent. Stamens 5 or 6, inserted in a nearly complete circle; filaments shorter than calyx lobes, glabrous. Ovary tomentose. Style equalling filaments, pubescent throughout. Fruit oblong-pyriform, 2.5-3 cm long; epicarp with sordid pulverulent-velutinous ferrugineous pubescence; pericarp thin, hard, fibrous, sparsely hirsutulous within.

Licania parvifructa Fanshawe & Maguire

DESCRIPTION

Leaf: shape oblong/ovate; **abaxial indumentum** pulverulent farinaceous; **petiole gland(s)** absent. **Inflorescence:** type panicle. **Flower:** receptacle shape campanulate; **pedicel** pedicellate; **stamen number** 3; **filament length** included; **filament fusion** free. **Fruit:** epicarp pulverulent.

ADDITIONAL DESCRIPTION

Trees, large. Branches glabrous when young and lenticels inconspicuous. Leaves with stipules 1-2 mm long, linear, coriaceous, persistent, adnate to extreme base of petiole; petioles 3-6 mm long, glabrous to hirsutulous, eglandular, canaliculate; lamina ovate to oblong, coriaceous, 4-9 × 2.5-3.5 cm, with a fine acumen 5-18 mm long at apex, rounded and subconduplicate at base; upper surface glabrous; lower surface shortly pulverulent-farinaceous pubescent; venation shallow; midrib glabrous above, more or less plane or slightly impressed at base; primary veins 7-11 pairs, prominent beneath, plane above. Inflorescences terminal and axillary branched panicles; rachis and branches glabrescent. Flowers c. 1.5 mm long, in cymules on long slender peduncles attached to primary inflorescence branches. Bracts and bracteoles 0.2-1.5 mm long, persistent. Receptacle campanulate, glabrescent on exterior, tomentellous within; pedicels 1-3 mm long. Calyx lobes acute; puberulous on both surfaces. Petals absent. Stamens 3, unilateral; filaments shorter than calyx lobes, glabrous, free to base. Ovary inserted at base of receptacle, hirsutulous. Style rising to base of calyx lobes, pubescent throughout. Fruit to 1.5 mm long, pyriform; epicarp pulverulent; mesocarp thin; endocarp hard, thin, sparsely hirsutulous within.

Licania piresii Prance

DESCRIPTION

Leaf: shape oblong; **abaxial indumentum** pulverulent farinaceous; **petiole gland(s)** absent. **Inflorescence:** type panicle. **Flower:** receptacle shape campanulate; **pedicel** pedicellate; **stamen number** 4/5; **filament length** included; **filament fusion** free. **Fruit:** **epicarp** unknown.

ADDITIONAL DESCRIPTION

Tree, small to medium-sized. Branches glabrous when young, lenticellate. Leaves with stipules coriaceous, linear, 2-3 mm long, persistent, adnate to base of petiole; petioles 3-4 mm long, glabrous, eglandular, shallowly canaliculate, rugose; lamina coriaceous, oblong, 6-15 × 3.5-6 cm; caudately acuminate at apex with acumen 5-12 mm long, subcuneate at base; upper surface glabrous; lower surface grey-pulverulent-farinaceous pubescent; primary vein glabrous, prominent above; secondary veins 7-9 pairs, prominent beneath, prominulous above; tertiary venation plane. Inflorescences terminal and axillary branched panicles; rachis and branches glabrous or glabrescent; bracts and bracteoles 0.2-0.7 mm long, persistent, puberulous; pedicels 0.25-0.5 mm long. Flowers c. 2 mm long, borne in 2- or 3-flowered cymules with short peduncles; receptacle campanulate, tomentellous outside, tomentose within. Calyx lobes acute, tomentellous on both surfaces. Petals absent. Stamens 4 or 5, unilateral; filaments shorter than calyx lobes, glabrous, free to base. Ovary inserted at base of receptacle, tomentellous. Style glabrous except around base. Fruit not seen.

DESCRIPTION

Leaf: shape elliptic/ovate; **abaxial indumentum** glabrous; **petiole gland(s)** absent. **Inflorescence:** type racemose panicle. **Flower:** receptacle shape campanulate; **pedicel** sessile; **stamen number** 6 - 7; **filament length** included; **filament fusion** free. **Fruit:** **epicarp** tomentose.

ADDITIONAL DESCRIPTION

Tree, medium to large-sized. Branches puberulous when young, becoming glabrous with age. Leaves with stipules lanceolate, 4-7 mm long, coriaceous, glabrous, persistent to subpersistent, adnate to base of petioles; petioles 6-14 mm long, terete, rugose, eglandular, short-velutinous when young; lamina ovate to elliptic, thick-coriaceous, 7-18 × 3-11 cm, acute to acuminate at apex with acumen to 10 mm long, subcordate or rounded to subcuneate at base, glabrous on both surfaces; palisade glands present; venation often minutely papillose on lower surface; midrib plane to prominulous above, glabrous; primary veins 6-10 pairs, prominent beneath, prominulous above. Inflorescences terminal racemose panicles; rachis and branches puberulous to short-tomentellous. Flowers 2.5-3.5 mm long, densely crowded in small groups on primary branches of inflorescence. Bracts and bracteoles lanceolate to elliptic, often equaling flowers, puberulous on both surfaces, persistent, entire. Receptacle campanulate, sessile, short-velutinous-tomentose on exterior, tomentose within. Calyx lobes acute, tomentellous on both surfaces. Petals absent. Stamens 6 or 7, unilateral; filaments shorter than calyx lobes, free to base, sparsely pubescent. Ovary on short gynophore, densely villous. Style equalling calyx lobes, pubescent throughout. Fruit pyriform; epicarp ferrugineoustomentose; pericarp thin, undifferentiated, fragile, granular, fibrous, sparsely hirsute within.

Licania pruinosa Benoist

DESCRIPTION

Leaf: shape oblong-elliptic/oblong; **abaxial indumentum** lanate farinaceous; **petiole gland(s)** absent. **Inflorescence:** type panicle. **Flower:** receptacle shape urceolate; pedicel sessile; stamen number 3; filament length included; filament fusion free. **Fruit:** epicarp unknown.

ADDITIONAL DESCRIPTION

Tree to 20 m tall. Branches glabrous when young, conspicuously lenticellate. Leaves with stipules linear, c. 3 mm long, glabrous, persistent, axillary; petioles 5-6 mm long, terete, glabrous, eglandular; lamina oblong to oblong-elliptic, membranous, 5-10 × 2-5 cm, acuminate at apex with acumen 4-11 mm long, cuneate at base, glabrous above, with short grey-brown lanate farinaceous pubescence beneath; midrib plane above, glabrous; primary veins 6-8 pairs, prominent beneath, plane above. Inflorescences terminal racemose panicles; rachis glabrescent; branches puberulous to tomentellous. Flowers 3.5-5 mm long, on primary branches of inflorescence. Bracts and bracteoles 0.2-0.5 mm long, triangular, persistent, puberulous on exterior. Receptacle urceolate, sessile, tomentellous on exterior, hirsute within. Calyx lobes acute, puberulous on both surfaces. Petals absent. Stamens 3, unilateral; filaments shorter than calyx lobes, glabrous. Ovary pilose. Style equalling filaments, hirsute. Fruit unknown.

Licania riedelii Prance

DESCRIPTION

Leaf: shape elliptic/oblong; **abaxial indumentum** stomatal-cavity; **petiole gland(s)** absent. **Inflorescence:** type racemose panicle. **Flower:** receptacle shape campanulate; **pedicel** subsessile; **stamen number** 5; **filament length** included; **filament fusion** free. **Fruit:** **epicarp** tomentulose.

ADDITIONAL DESCRIPTION

Shrubs. Branches puberulous when young, glabrescent, lenticellate. Leaves: stipules linear, 1.5-2 mm long, persistent, puberulous, adnate to base of petiole; petioles 3-5 mm long, terete, eglandular, puberulous; lamina elliptic to narrowly oblong, thickly coriaceous, $5-10.5 \times 1.6-4.7$ cm, acute at apex, rounded at base, glabrous and shiny above, with stomatal cavities filled with lanate pubescence beneath; venation glabrous and conspicuous; midrib impressed above, tomentose when young; primary veins 9-10 pairs, prominent beneath, plane or slightly impressed above. Inflorescences of dense terminal and axillary racemose panicles; rachis and branches ferrugineous-pubescent. Bracts and bracteoles 0.5-2 mm long, ovate, persistent, ferrugineous-pubescent on exterior. Flowers 2.5-3 mm long. Receptacle campanulate, subsessile, ferrugineous-tomentose on exterior, tomentose within. Calyx lobes acute, tomentose on both surfaces. Petals absent. Stamens 5, unilateral; filaments glabrous, free to base, shorter than calyx lobes. Ovary tomentose. Style pubescent to apex, shorter than calyx lobes. Fruit pyriform, 1.5 cm long; exocarp tomentellous; mesocarp 2-3 mm thick; endocarp thin, hard, pubescent within.

DESCRIPTION

Leaf: shape elliptic; **abaxial indumentum** lanate; **petiole gland(s)** absent. **Inflorescence:** type racemose panicle. **Flower:** receptacle shape campanulate/urceolate; **pedicel** subsessile; **stamen number** 5 - 6; **filament length** included; **filament fusion** free. **Fruit:** **epicarp** pubescent.

ADDITIONAL DESCRIPTION

Tree to 25 m tall. Branches glabrous when young, conspicuously lenticellate. Leaves with stipules linear, c. 4 mm long, glabrous, persistent, adnate to base of petiole; petioles 1.2-2 cm long, glabrous, eglandular, canaliculate; lamina elliptic, coriaceous, 8-25 × 4.5-8.5 cm, acuminate at apex with acumen 5-15 mm long, rounded at base, glabrous above; lower surface with dense brown-lanate pubescence obscuring the prominent deeply reticulate venation; midrib prominulous above, glabrous; primary veins 6-8 pairs, prominent beneath, prominulous above. Inflorescences terminal and subterminal racemose panicles; rachis glabrous or glabrescent, lenticellate, with puberulous to tomentellous branches. Flowers 2.5-3 mm long, solitary or in small groups on primary branches of inflorescence. Bracts and bracteoles 0.3-1.5 mm long, triangular to linear, subpersistent; exterior puberulous. Receptacle narrowly campanulate to urceolate, subsessile; exterior tomentellous; interior tomentose. Calyx lobes acute, tomentellous on both surfaces. Petals absent. Stamens 5 or 6, unilateral; filaments shorter than calyx lobes, glabrous. Ovary tomentose. Style equalling filaments, lanate. Fruit (immature) oblong; epicarp with short yellow-brown pubescence.

Licania rufescens Klotzsch ex Fritsch

DESCRIPTION

Leaf: shape oblong-elliptic; **abaxial indumentum** rufous lanate; **petiole gland(s)** absent. **Inflorescence:** type racemose panicle. **Flower:** receptacle shape campanulate; **pedicel** sessile; **stamen number** 5 - 6; **filament length** included; **filament fusion** free. **Fruit:** epicarp unknown.

ADDITIONAL DESCRIPTION

Trees to 35 m tall. Branches puberulous when young. Leaves: stipules lanceolate, to 3 mm long, axillary, pubescent, caducous; petioles 5-8 mm long, tomentellous, shallowly canaliculate, eglandular; lamina oblong-elliptic, coriaceous, 5-10 × 1.8-5.5 cm, acuminate or acute at apex with acumen to 8 mm long, subcuneate at base, glabrous above, with rufous-lanate pubescence beneath obscuring deeply reticulate venation; midrib usually impressed above, glabrous; primary veins 5-8 pairs, prominent beneath, usually slightly impressed above. Inflorescences terminal and subterminal racemose panicles; rachis and branches rufoustomentellous. Flowers c. 2 mm long, sessile on primary branches of inflorescence. Bracts and bracteoles 0.5-1 mm long, ovate, tomentellous on exterior, persistent. Receptacle sessile, campanulate, tomentose on exterior and within. Calyx lobes acute, tomentellous on both surfaces. Petals absent. Stamens 5 or 6, unilateral; filaments shorter than calyx lobes, free to base, glabrous. Ovary pilose. Style rising to base of filaments, pilose throughout. Fruit unknown.

Licania sandwithii Prance

DESCRIPTION

Leaf: shape ovate orbicular; **abaxial indumentum** lanate/farinaceous; **petiole gland(s)** absent. **Inflorescence:** type racemose panicle. **Flower:** receptacle shape cupuliform; **pedicel** sessile; **stamen number** 6 - 8; **filament length** included; **filament fusion** free. **Fruit:** **epicarp** unknown.

ADDITIONAL DESCRIPTION

Trees. Branches rufous-hirsutulous when young, soon becoming glabrous and lenticellate. Leaves: stipules elliptic, 3-5 mm long, hirsutulous, persistent, axillary; petioles 4-5 mm long, densely hirsutulous, terete, eglandular; lamina thickly coriaceous, ovate-orbicular, 6-11.5 × 4-7.5 cm; rounded to acute at apex, rounded at base, glabrous and shiny above, lanate-farinaceous pubescent and deeply reticulate beneath; midrib slightly impressed, hirsutulous on basal portion above, hirsutulous beneath; primary veins 7-9 pairs, impressed and glabrous above, prominent and hirsutulous beneath. Inflorescences terminal and axillary racemose panicles; rachis and branches rufous-tomentose. Bracts and bracteoles ovate, to 3 mm long, persistent, tomentose on exterior. Flowers 3.5-5 mm long, sessile. Receptacle broadly cupuliform, densely rufous tomentose on both surfaces. Calyx lobes acute, tomentose on both surfaces. Petals absent. Stamens 6-8, unilateral; filaments free to base, glabrous, shorter than calyx lobes. Ovary villous. Style villous, shorter than calyx lobes. Fruit not seen.

Licania santosii Prance

DESCRIPTION

Leaf: shape ovate orbicular; **abaxial indumentum** stomatal-cavity; **petiole gland(s)** absent. **Inflorescence:** type panicle. **Flower:** receptacle shape campanulate; **pedicel** pedicellate; **stamen number** 7; **filament length** included; **filament fusion** free. **Fruit:** epicarp unknown.

ADDITIONAL DESCRIPTION

Trees to 4 m tall. Branches glabrous when young, conspicuously lenticellate. Leaves: stipules adnate to extreme base of petioles, persistent, lanceolate, c. 2 mm long; petioles 8–10 mm long, terete, sparsely puberulous when young, eglandular, slightly rugulose; lamina ovate-orbicular, coriaceous, becoming thickly coriaceous with age, 6–10 × 4–6.5 cm, rounded at base, rounded to slightly acute at apex; upper surface glabrous; lower surface with stomatal crypts filled by dense lanate pubescence; venation reticulate and conspicuous since it is not covered by pubescence; midrib plane above, prominent beneath; primary veins 7 or 8 pairs, plane above, prominent beneath. Inflorescences of little-branched panicles 3–4 cm; rachis and branches brown-tomentellous. Bracts and bracteoles 1–2 mm long, ovate, persistent, tomentellous on exterior. Flowers c. 2.5 mm long, in few-flowered cymules attached to rachis and primary branches by long slender peduncles. Receptacle campanulate, brown-tomentellous on exterior, tomentose within; pedicels 0.2 mm long. Calyx lobes 5, acute, tomentellous-puberulous on both surfaces. Petals absent. Stamens 7, inserted around complete circle; anthers and filaments of variable size; filaments shorter than calyx lobes, glabrous, free to base. Ovary villous. Style extending to base of filaments, tomentose on lower 1/2. Fruit not seen.

Licania savannarum Prance

DESCRIPTION

Leaf: shape elliptic/oblong/oblong lanceolate; **abaxial indumentum** lanate farinaceous; **petiole gland(s)** absent. **Inflorescence:** type panicle. **Flower:** receptacle shape urceolate; **pedicel** sessile; **stamen number** 3; **filament length** included; **filament fusion** free. **Fruit:** epicarp glabrous.

ADDITIONAL DESCRIPTION

Shrubs or small trees. Branches puberulous when young, soon becoming glabrous and lenticellate. Leaves: stipules to 1 mm long, linear, caducous, extrapetiolar; petioles 2-3 mm long, glabrous, eglandular, rugose, terete; lamina elliptic or oblong-lanceolate, coriaceous, 3-8 × 1.2-3.5 cm, glabrous above, with a dense lanate-farinaceous pubescence beneath; apex rounded to acute; base cuneate to subcuneate; midrib glabrous and plane above; primary veins 5-8 pairs, prominulous beneath, plane above. Flowers 2.5-3 mm long. Inflorescence of terminal and axillary panicles; rachis and branches densely puberulous. Bracts and bracteoles 0.5-1.5 mm long, linear, persistent, tomentellous on exterior. Receptacle urceolate, sessile, rufous-brown-tomentose on exterior, tomentose within. Calyx lobes acute, tomentose on both surfaces. Petals absent. Stamens 3, unilateral; filaments glabrous, shorter than calyx lobes, free to base. Ovary tomentose. Style hirsute to mid point. Fruit pyriform; exocarp glabrous, rugose when dry; mesocarp thin; endocarp thick, woody, hard, hirsute within.

Licania silvae Prance

DESCRIPTION

Leaf: shape oblong-elliptic/oblong; **abaxial indumentum** glabrous; **petiole gland(s)** present. **Inflorescence:** type panicle. **Flower:** receptacle shape campanulate; **pedicel** sessile; **stamen number** 3; **filament length** included; **filament fusion** free. **Fruit:** epicarp unknown.

ADDITIONAL DESCRIPTION

Trees. Branches sparsely puberulous when young, soon becoming glabrous and lenticellate. Leaves: stipules minute, lanceolate, coriaceous, subpersistent, extrapetiolar; petioles 2-4 mm long, glabrous, rugose, terete, with 2 glands near to lamina base; lamina oblong to oblongelliptic, coriaceous, 6-11.5 × 2.5-5.5 cm, glabrous on both surfaces, with pustulate venation beneath; apex acute to acuminate with acumen 2-6 mm long; base rounded to subcuneate; midrib glabrous, prominulous above; primary veins 7-8 pairs, prominulous on both surfaces. Flowers c. 1.5 mm long. Inflorescence of terminal and subterminal panicles; rachis and branches densely puberulous. Receptacle campanulate, sessile, tomentellous on exterior, tomentose within. Calyx lobes acute, tomentellous on both surfaces. Petals absent. Stamens 3, unilateral; filaments shorter than calyx lobes, sparsely puberulous, free to base. Ovary tomentose. Style villous to apex. Fruit unknown.

DESCRIPTION

Leaf: shape oblong; **abaxial indumentum** lanate; **petiole gland(s)** absent. **Inflorescence:** type racemose panicle/spike(s).

Flower: receptacle shape globose/cupuliform; **pedicel** sessile; **stamen number** 5 - 6; **filament length** included; **filament fusion** free. **Fruit:** **epicarp** tomentose.

ADDITIONAL DESCRIPTION

Tree. Branches puberulous when young, becoming glabrous and lenticellate with age. Leaves with stipules deciduous (not seen); petioles 6-9 mm long, tomentellous, canaliculate, eglandular; lamina oblong, subcoriaceous, 4.5-9 × 1.5-3.7 cm, with finely pointed acumen 5-15 mm long, subcuneate to cuneate at base; upper surface glabrous or sparsely strigose when young, densely yellow-brown lanate below; midrib slightly impressed above, glabrous; primary veins 8-11 pairs, prominent beneath, plane above. Inflorescences comprising axillary unbranched spikes and terminal few-branched racemose panicles; rachis and branches puberulous to tomentellous. Flowers c. 2.5 mm long, on rachis and primary branches of inflorescence. Bracts and bracteoles 0.3-0.8 mm long, ovate, persistent, tomentellous on exterior. Receptacle cupuliform-globose, sessile, tomentellous to puberulous on exterior, tomentose within. Calyx lobes acute, tomentellous on exterior, puberulous within. Stamens 5 or 6, slightly unilateral; filaments shorter than calyx lobes, glabrous. Ovary villous. Style equalling filaments, villous throughout. Fruit (immature) with densely tomentose epicarp.

Licania stewardii Prance

DESCRIPTION

Leaf: shape oblong; **abaxial indumentum** lanate/waxy; **petiole gland(s)** absent. **Inflorescence:** type racemose panicle. **Flower:** receptacle shape campanulate; **pedicel** pedicellate; **stamen number** 9 - 11; **filament length** included; **filament fusion** fused basally. **Fruit:** epicarp unknown.

ADDITIONAL DESCRIPTION

Trees, 3-5 m tall. Branches puberulous when young, soon glabrate. Leaves: stipules linear, 2-3 mm long, persistent, tomentellous, adnate to petioles; petioles 1.5-2.5 mm long, terete, eglandular, tomentellous when young; lamina oblong, chartaceous, 4-8 × 2.2-4 cm, rounded or subcordate at base, rounded, acute or retuse at apex, glabrous above with a waxy lanate appressed pubescence beneath; midrib slightly impressed above, prominent beneath; primary veins 7-9 pairs, plane above, prominent beneath; secondary venation conspicuously reticulate. Inflorescences of terminal or subterminal little branched racemose panicles or simple racemes 2-7 cm long; rachis and branches grey-tomentellous. Bracts and bracteoles narrowly lanceolate, 1-2 mm long, tomentellous on exterior, persistent. Flowers 3-3.5 mm long. Receptacle campanulate, grey-tomentellous on exterior, lanate within; pedicels 0.25-0.5 mm long. Calyx lobes 5, acute, grey-tomentellous on exterior, puberulous within. Petals absent. Stamens 9-11, inserted around complete circle, shorter than calyx lobes; filaments connate at base, with united part lanate. Ovary densely lanate. Style equalling filaments. Fruit unknown.

Licania teixeirae Prance

DESCRIPTION

Leaf: shape ovate; **abaxial indumentum** waxy; **petiole gland(s)** absent. **Inflorescence:** type raceme/racemose panicle. **Flower:** receptacle shape urceolate; **pedicel** sessile; **stamen number** 5; **filament length** included; **filament fusion** free. **Fruit:** **epicarp** unknown.

ADDITIONAL DESCRIPTION

Trees. Branches glabrous when young, lenticellate. Leaves: stipules linear, 1 mm long, adnate to base of petiole; petioles 4-6 mm long, glabrous, canaliculate; lamina narrowly ovate, chartaceous, $4.5-5.5 \times 1.7-2.3$ cm, subcuneate and slightly unequal at base, caudate at apex with acumen 1.2-1.8 mm long, glabrous above, with a waxy pulverulent-farinaceous pubescence beneath; midrib glabrous and plane above, prominent beneath; primary veins 7-9 pairs, inconspicuous on both surfaces. Inflorescences of terminal and axillary little-branched racemose panicles or racemes; rachis and branches tomentellous; apical panicles 3-4 cm long; axillary racemes 1-2 cm long. Bracts and bracteoles lanceolate, persistent, c. 0.5 mm long, tomentellous. Flowers c. 3 mm long, sessile on primary branches of inflorescence. Receptacle urceolate, sessile, rufous-brown-tomentellous on exterior, densely tomentellous within. Calyx lobes 5, acute, rufous-brown-tomentellous on exterior contrasting sharply with grey-white-tomentellous pubescence of inner surface. Petals absent. Stamens 5, inserted around 2/3 of circle; filaments shorter than calyx lobes, tomentellous. Ovary sparsely tomentellous on exterior. Style equalling filaments, lanate-pubescent. Fruit unknown.

DESCRIPTION

Leaf: shape oblong/ovate elliptic; **abaxial indumentum** stomatal-cavity; **petiole gland(s)** absent. **Inflorescence:** type racemose panicle. **Flower:** receptacle shape campanulate; **pedicel** sessile; **stamen number** 3; **filament length** included; **filament fusion** free. **Fruit:** **epicarp** short velutinous.

ADDITIONAL DESCRIPTION

Trees to 26 m tall. Branches puberulous when young, soon becoming glabrous and lenticellate. Leaves: stipules 3-4 mm long, lanceolate, glabrous, persistent, axillary; petioles 5-9 mm long, puberulous when young, soon becoming glabrous, terete, eglandular; lamina ovate-elliptic to oblong, thick-coriaceous, 7-17 × 4-10 cm, caudate-acuminate or acuminate at apex with acumen 5-15 mm long, rounded at base, glabrous above; margins plane; lower surface with deeply reticulate venation and poorly developed stomatal cavities; venation glabrous or glabrescent (hence conspicuous), usually with several conspicuous glands on lower surface of lamina towards base; midrib plane above, glabrous; primary veins 7-9 pairs, prominent beneath, plane above. Inflorescences terminal and subterminal racemose panicles; rachis and branches tomentellous. Flowers c. 2 mm long, sessile on primary branches of inflorescence. Bracts and bracteoles 0.5-1 mm long, triangular, persistent, puberulous on exterior. Receptacle campanulate, sessile, tomentose on exterior, tomentose within. Calyx lobes acute, tomentellous on exterior, puberulous within. Petals absent. Stamens 3, unilateral; filaments shorter than calyx lobes, glabrous. Ovary tomentose. Style equalling filaments, pilose throughout. Fruit pyriform, to 3.5 cm long; epicarp short-velutinous; pericarp thin, hard, fibrous, sparsely hirsutulous to glabrous within.

Licania urceolaris Hook.f.

DESCRIPTION

Leaf: shape oblong ovate; **abaxial indumentum** waxy/pulverulent farinaceous; **petiole gland(s)** present. **Inflorescence:** type racemose panicle. **Flower:** receptacle shape urceolate; **pedicel** sessile; **stamen number** 5; **filament length** included; **filament fusion** free. **Fruit:** epicarp glabrous.

ADDITIONAL DESCRIPTION

Trees to 25 m tall. Branches puberulous when young, becoming glabrous and lenticellate with age. Leaves: stipules c. 2 mm long, lanceolate, coriaceous, adnate to base of petiole, caducous or subpersistent; petioles 3-6 mm long, terete or shallowly canaliculate, puberulous, becoming glabrous with age, with 2 medial sessile glands; lamina oblong-ovate, chartaceous to coriaceous, 5.5-12.5 × 2.5-6.2 cm, with a well developed acumen 4-12 mm long, rounded to subcuneate at base; margins plane; upper surface glabrous; lower surface short waxy grey-pulverulent farinaceous pubescent; venation glabrous beneath; midrib glabrous above, plane or slightly impressed; primary veins 6-10 pairs, prominulous beneath, plane above. Inflorescences little-branched terminal and axillary racemose panicles; rachis and branches tomentellous. Flowers 3-4 mm long, solitary or in small groups along primary branches of inflorescence. Bracts and bracteoles 0.5-1.5 mm long, deltoid, persistent, tomentellous on exterior. Receptacle urceolate, sessile, tomentose on exterior, tomentellous within. Calyx lobes acute, tomentellous on both surfaces. Petals absent. Stamens 5, inserted in an arc of c. 270°; filaments shorter than calyx lobes, glabrous, free to base. Ovary tomentose. Style equalling filaments, sparsely pubescent to glabrous. Fruit (immature) pyriform; epicarp glabrous, drying yellow and wrinkled; mesocarp thin; endocarp thick, hard, pubescent within.

DESCRIPTION

Leaf: shape elliptic; **abaxial indumentum** lanate; **petiole gland(s)** absent. **Inflorescence:** type panicle. **Flower:** receptacle shape campanulate; **pedicel** sessile; **stamen number** 5 - 7; **filament length** included; **filament fusion** free. **Fruit:** epicarp pubescent.

ADDITIONAL DESCRIPTION

Tree. Branches puberulous when young, soon becoming glabrous and lenticellate. Leaves with stipules linear, c. 5 mm long, intrapetiolar or adnate to inside of extreme base of petiole, puberulous, persistent; petioles 4-7 mm long, puberulous, terete, eglandular; lamina elliptic, coriaceous, 7-14 × 3.7-5.5 cm, with acumen 5-10 mm long, rounded at base, glabrous above, densely brown-lanate beneath; midrib impressed above, pubescent towards base; primary veins 11 or 12 pairs, prominent beneath, plane above. Inflorescences terminal and subterminal panicles; rachis and branches puberulous. Flowers c. 2 mm long, in small subsessile groups or solitary on primary branches of inflorescence. Bracts and bracteoles to 1 mm long, triangular, persistent, puberulous on exterior. Receptacle campanulate, sessile, tomentose on exterior and within. Calyx lobes acute, tomentellous on both surfaces. Petals absent. Stamens 5-7, unilateral; filaments shorter than calyx lobes, glabrous. Ovary tomentose. Style equalling filaments, tomentose throughout. Fruit (immature) oblong; epicarp sordid-ferruginous pubescent, wrinkled when dry; pericarp thin, hard, woody, sparsely hirsute within.

This treatment is composed of the following taxa: *Microdesmia*, *Microdesmia arborea*, *Microdesmia rigida*.

HOW TO CITE

Sothers, C.A., Prance, G.T. 2020. *Microdesmia* in **Flora do Brasil 2020**. Jardim Botânico do Rio de Janeiro. Available at: <http://floradobrasil.jbrj.gov.br/reflora/floradobrasil/FB604709>.

DESCRIPTION

Trees to 20 m. Leaf: stipules linear, axillary, caducous; lamina lower surface lanate-pubescent and deeply reticulate; with hair-filled stomatal cavities present. Petiole with two glands. Bracteoles small, persistent, not enclosing flower buds. Inflorescence racemose panicles. Flowers bisexual, sub-actinomorphic. Sepals 5. Petals 5. Stamens 8–14, inserted in a complete circle, equalling calyx lobes; filaments equalling calyx lobes, connate for half their length. Ovary 1-carpellary, 1-locular, inserted at base of receptacle. Style filiform, indistinctly 3-lobed at apex. Fruit a drupe, 3–5.5 cm long; epicarp smooth, glabrous; endocarp thin, fragile, and fibrous, with fibres arranged longitudinally, promoting longitudinal dehiscence; sparsely pubescent or glabrous within.

COMMENTS

A genus of two species with essentially allopatric distribution. *Microdesmia arborea* is widely distributed from Mexico and Central America to northwestern South America. *M. rigida* is restricted to northeastern Brazil. Both species produce a seed oil used in paints, soaps, candles and as grease; their wood is durable and used for building and construction purposes. As a result they have been cultivated extensively.

DESCRIPTION

Leaf: shape elliptic/ovate; **petiole** gland(s). **Flower:** stamen number 8 - 12; **receptacle** campanulate. **Fruit:** exocarp glabrous/smooth.

COMMENTS

Tree to 20 m tall. Branches pubescent when young, soon becoming glabrous. Leaves with stipules to 3 mm long, linear, axillary, membranous, caducous; petioles 5-12 mm long, terete, tomentose when young, glabrescent, with 2 sessile glands near lower surface of lamina; lamina ovate-orbicular to oblong, 5-12 × 2.5-8 cm on fertile branches (usually much larger on sterile branches), glabrous and shining above; lower surface with deep reticulation quite or nearly describing stomatal cavities, lanate-pubescent among venation, sometimes with dense lanate pubescence obscuring venation when young; apex obtuse, rounded, or retuse; base cordate to rounded; midrib prominulous above, glabrous; primary veins 11-18 pairs, prominent beneath, slightly impressed above. Inflorescences terminal and axillary racemose panicles; rachis and branches densely brown to ferruginous-tomentose. Flowers 2.5-3 mm long, solitary and densely clustered on primary and secondary branches of inflorescence. Bracts and bracteoles deltoid to lanceolate, to 1.5 mm long, persistent, tomentose on exterior, puberulous within, entire to serrulate, eglandular. Receptacle campanulate, sessile, tomentose on exterior, villous within. Calyx lobes acute, tomentose on both surfaces. Petals 5, small, oblong, pubescent. Stamens 8-12, inserted in a complete circle; filaments equaling calyx lobes, connate in groups for 1/2 their length, densely villous. Ovary densely pilose. Style equaling filaments, pilose throughout. Fruit oblong, to 3 cm long; epicarp smooth and glabrous, drying black or green; mesocarp thin and fleshy; endocarp thin, soft and fibrous, with fibres arranged longitudinally, glabrous within.

DESCRIPTION

Leaf: shape elliptic/ovate; **petiole** gland(s). **Flower:** stamen number 14; receptacle campanulate. **Fruit:** exocarp glabrous/smooth.

ADDITIONAL DESCRIPTION

Tree to 15 m tall, with spreading crown. Branches lanate to tomentellous when young, soon becoming glabrous and lenticellate. Leaves with stipules linear, to 10 mm long, membranous, caducous; petioles 5-8 mm long, tomentose when young, becoming glabrescent with age, terete, with 2 sessile glands; lamina oblong to elliptic, 6-13 (-16) × 2.8-6.5 cm, coriaceous, rounded to retuse at apex, rounded to cordate at base, glabrous and shining on upper surface; lower surface with deeply reticulate venation quite or nearly describing stomatal cavities, with lanate pubescence among but not on venation; midrib prominulous above, puberulous towards base when young; primary veins 11-16 pairs, prominent on lower surface, prominulous above. Inflorescences racemose panicles; rachis and branches grey-tomentose. Flowers 2.5-3.5 mm long, in small groups, sessile on primary branches of inflorescence. Bracts and bracteoles 1.5-2.5 mm long, ovate, tomentose on exterior, persistent, entire to serrulate, eglandular. Receptacle campanulate, grey-tomentose on exterior, tomentose within; pedicels to 0.5 mm long. Calyx lobes acute, tomentose on exterior, tomentellous within. Petals 5, densely pubescent. Stamens c. 14; filaments equalling calyx lobes, connate to about 1/2 way from base, densely pubescent. Ovary villous. Style equalling calyx lobes, villous nearly to apex. Fruit elliptic, 4-5.5 cm long; epicarp smooth, drying green or black; mesocarp thin, fleshy; endocarp thin, fibrous, fragile, with fibres arranged longitudinally promoting longitudinal dehiscence, sparsely pubescent within.

DESCRIPTION

Trees. Leaves: stipules small, subulate, lateral or axillary, usually persistent; lamina lower surface glabrous or lanate. Petiole with or without glands. Inflorescence panicles, racemes or racemose panicles. Bracts and bracteoles small, usually eglandular and not enclosing the flower-buds. Flowers bisexual, sub-actinomorphic. Receptacle globose, cupuliform, or campanulate, hairy within, but throat without long retrorse hairs. Sepals 5. Petals 4–5. Stamens 11–60 (–90), in 1–several rows, inserted in a complete circle; filaments usually far exceeding calyx lobes, less frequently only slightly exceeding or rarely equalling the calyx lobes, free or slightly united at base; staminodes usually absent, rarely represented by a short denticulate ridge. Style filiform, indistinctly 3-lobed at apex. Ovary 1-carpellary, 1-locular, inserted at base of receptacle. Fruit to 11–15 × 10 cm, epicarp glabrous, smooth, lenticellate, crustaceous or pubescent; endocarp glabrous or sparsely pubescent within, without any special mechanisms for seedling escape.

COMMENTS

A genus with 54 species distributed from Mexico, Central America (Panama, Nicaragua and Costa Rica), the Leeward and Windward Islands, and throughout most of South America.

IDENTIFICATION KEY

1. Petals unguiculate; fruit usually drawn out into a pointed apex.
 2. Flowers 5-6 mm long; pedicels 2-2.5 mm long, ovary pilose..... **M. unguiculata**
 2. Flowers 3 mm long; pedicels 0-0.25 mm long; ovary glabrescent..... **M. longipetala**
1. Petals not unguiculate, rounded at base; fruit without pointed apex.
 3. Inflorescence and exterior of receptacle entirely glabrous.
 4. Leaf broadly acuminate, the acumen 4-8 mm long; flowers 2.5-3 mm tall; pedicels 2-5 mm long..... **M. salzmannii**
 4. Leaf apex with finely pointed acumen 8-22 mm long; flowers 4-6 mm tall; pedicels 1-3 mm long..... **M. guianensis**
 3. Inflorescence and exterior of receptacle pubescent, usually densely tomentose.
 5. Pedicels 3-7 mm long; leaf apex finely acuminate, the acumen 1.5-2.5 cm long; stamens 35-45..... **M. longipedicellata**
 5. Pedicels 0-2.5 mm long; leaf apex blunt acuminate, the acumen less than 10 mm long; stamens 14-30.
 6. Stamens equalling calyx-lobes in length; flowers sessile;
 7. Stipules 8-12 mm long. linear, subpersistent; leaf lower surface glabrous; petioles 6-9 mm long; stamens c. 25..... **M. silvatica**
 7. Stipules c 1 mm, persistent; leaf lower surface densely lanate-pubescent; petioles 2-3 mm long; stamens 15-17..... **M. araneosa**
 6. Stamens exserted beyond calyx-lobes; flowers with pedicels 0.5-1 mm long (except sessile in *M. maranhensis*).
 8. Inflorescence predominantly of axillary racemes or few-branched panicles **M. tomentosa**
 8. Inflorescence of predominantly terminal much-branched panicles.
 9. Primary leaf veins slightly impressed above; laminas oblong-lanceolate, 10-25 cm long.
 10. Petioles 10-13 mm long; leaves 10-14.5 x 2.5-5.2 cm; primary veins 11-17 Pairs; stamens 17..... **M. angustata**
 10. Petioles 5-7 mm long; leaves 14-25 x 4.5-8 cm; primary veins 18-22 pairs; stamens 12-14..... **M. anneae**
 9. Primary leaf veins plane or prominulous above; laminas elliptic or ovate, 4.5-15.5 cm long (to 18.5 cm in *M. maranhensis*)
 11. Leaf base subcordate; leaves 15-18.5 x 7.5-9.5 cm; flowers sessile; petioles 3-5 mm long..... **M. maranhensis**
 11. Leaf base cuneate to rounded; leaves not exceeding 15.5 cm long; flowers pedicellate; petioles 6-12 mm long (except in *M. egleri* 2-5 mm).
 12. Petioles 2-5 mm long; leaf apex retuse or apiculate at apex..... **M. egleri**
 12. Petioles 6-12 mm long; leaf apex acuminate or apiculate.
 13. Inflorescence rachis and branches sparsely grey-pubescent.... **M. fritschii**
 13. Inflorescence rachis and branches tomentose.
 14. Flowers 2 mm long, buds globose; leaves 5.5-11 x 2-6 cm. **M. minutiflora**
 14. Flowers 2.5-3 mm long, buds ovoid; leaves 8-16 x 3-7.5 cm. **M. brittoniana**

Has as synonym

basionym *Licania anneae* Prance

DESCRIPTION

Leaf: shape oblong/lanceolate; **indumentum** pilose; **petiole gland(s)** absent. **Inflorescence:** type panicle/racemose. **Flower:** **stamen number** exserted/12 - 14; **pedicel** subsessile; **receptacle** cupuliform. **Fruit:** **epicarp** unknown.

ADDITIONAL DESCRIPTION

Trees to 7 m tall. Branches sparsely puberulous when young, soon becoming glabrous. Leaves: stipules caducous (not seen); petiole 5-7 mm long, rugulose, slightly canaliculate, puberulous when young; lamina oblong-lanceolate, coriaceous, 14-25 × 4.5-8 cm, rounded at the base, shortly acuminate or acute at the apex (acumen 2-6 mm long), glabrous above, pilose with a few sparse appressed hairs beneath, especially on the primary veins; midrib glabrous and prominulous above, prominent and puberulous beneath; primary veins 18-22 pairs, slightly impressed above, prominent and puberulous beneath, arcuate and conspicuously anastomosing c. 2-3 mm from the margin. Inflorescences terminal and axillary racemose panicles; rachis and branches light brown-tomentellous. Bracts 5-18 mm long, oblong to lanceolate, membranous, persistent, tomentellous on the exterior, sparsely puberulous within; bracteoles ovate, persistent, membranous, glabrous or with a few sparse hairs and ciliate margins. Flowers 3-3.5 mm long, inserted on primary branches of inflorescence. Receptacle cupuliform, extremely regular and round at the apex, short brown-tomentellous on exterior, tomentellous within. Calyx lobes 5, acute, triangular, small, tomentellous on both surfaces, but more sparsely on inner surface. Petals 5, oblong, white, glabrous with ciliate margins, caducous. Stamens 12-14, inserted around a complete circle, filaments slightly exceeding calyx lobes, glabrous, connate at base forming a ring 1 mm tall that is hirsute on both surfaces. Ovary tomentose-pilose. Style lanate almost to apex. Fruit unknown.

Moquilea araneosa (Taub.) Sothers & Prance

Has as synonym

basionym *Licania araneosa* Taub.

DESCRIPTION

Leaf: shape oblong/lanceolate; **indumentum** glabrous; **petiole gland(s)** absent. **Inflorescence:** type panicle. **Flower:** stamen number equal/15/17; **pedicel** sessile; **receptacle** cupuliform. **Fruit:** epicarp glabrous/verrucose.

ADDITIONAL DESCRIPTION

Trees. Branches tomentellous when young, becoming glabrous with age, not lenticellate.

Leaves: stipules c. 1 mm long, linear, coriaceous, persistent, extrapetiolar; petioles 2-3 mm long, lanate, eglandular, terete; lamina oblong-lanceolate, coriaceous, 2-7 × 1.3-3 cm, acute or short-mucronate at apex with acumen not exceeding 1 mm long, cuneate at base, glabrous above, with easily rubbed off lanate pubescence beneath; midrib prominulous above, lanate; primary veins 9-11 pairs, prominulous beneath, plane above. Inflorescences terminal and axillary little branched panicles; rachis and branches tomentellous. Flowers 1.5 mm long, sessile on primary and secondary branches of inflorescence. Bracts and bracteoles 0.5-2.5 mm long, ovate to linear, pubescent on exterior. Receptacle cupuliform, sessile, tomentose on exterior, densely tomentose within. Calyx lobes acute, tomentose on exterior, glabrous within. Petals 5, sparsely pubescent, ciliate. Stamens 15-17, inserted in a complete circle; filaments equalling calyx lobes, free to base, glabrous. Ovary pilose. Fruit (immature) globose; epicarp glabrous, verrucose; mesocarp thin, fleshy; endocarp thin, granular, fragile.

homotype *Licania brittoniana* Fritsch

heterotypic *Licania elata* (Pilg.) Pilg. ex Ll.Williams

heterotypic *Moquilea elata* Pilg.

DESCRIPTION

Leaf: shape oblong-elliptic; **indumentum** glabrous; **petiole gland(s)** absent. **Inflorescence:** type panicle/racemose. **Flower:** stamen number exserted/16 - 23; pedicel pedicellate; receptacle campanulate. **Fruit:** epicarp crustaceous.

ADDITIONAL DESCRIPTION

Trees to 50 m tall. Branches glabrous and lenticellate when young. Leaves: stipules 2 mm long, subulate, glabrous, persistent, axillary; petioles 8-12 mm long, with sparse arachnoid pubescence when young, glabrescent, shallowly canaliculate, eglanular; lamina oblong-elliptic to oblong, coriaceous, 8-15.5 × 3-7 cm, acuminate at apex with acumen 3-7 mm long, rounded to subcordate at base, glabrous on both surfaces; palisade glands present beneath, with 2 glands at junction of lamina and petiole on lower surface; midrib glabrous above, plane or nearly so; primary veins 9-15 pairs, prominulous above, prominent beneath. Inflorescences terminal racemose panicles; rachis and branches grey-tomentose. Flowers 2-3 mm long, solitary but densely crowded on primary and secondary branches of inflorescence. Bracts and bracteoles c. 1.5 mm long, caducous, tomentose on exterior. Receptacle campanulate, grey-tomentose on exterior, pilose-tomentose within; pedicels 0.5 mm long. Calyx lobes acute, tomentose on exterior, puberulous within. Petals 5, sparsely pubescent; margins ciliate. Stamens 16-23, inserted in a complete circle; filaments far exceeding calyx lobes, with bases slightly connate. Carpels 1 (-2), with second carpel occasionally developing. Ovary inserted at base of receptacle, lanate. Style pilose almost to apex, equalling filaments. Fruit ovoid to 8 cm long; epicarp crustaceous; mesocarp thick and hard; endocarp thin, hard, sparsely pubescent within.

DESCRIPTION

Leaf: shape elliptic/ovovate; **indumentum** glabrous; **petiole gland(s)** absent. **Inflorescence:** type panicle/racemose. **Flower:** stamen number exserted/15; **pedicel** pedicellate; **receptacle** campanulate. **Fruit:** epicarp glabrous/smooth.

ADDITIONAL DESCRIPTION

Trees, small to medium sized. Branches glabrous when young, lenticellate. Leaves: stipules small, 1-2 mm long, ovate, membranous, axillary, subpersistent; petiole 2-5 mm long, glabrous, rugose, terete, eglandular; lamina obovate to elliptic, coriaceous, 4.5-8.5 × 2-4 cm, glabrous on both surfaces with glands on lower surface and 2 glands at junction with petiole; apex retuse or shortly apiculate; base rounded to subcuneate; midrib prominent and glabrous above; secondary veins 8-13 pairs, prominulous on both surfaces, inconspicuous. Inflorescence of terminal and subterminal racemose panicles; rachis and branches puberulous. Bracts and bracteoles 0.5-1.5 mm long, ovate, membranous, persistent, sparsely pubescent. Flowers 2-2.5 mm long. Receptacle campanulate, grey-tomentellous on exterior, tomentose within; pedicels 0.5-1 mm long. Calyx lobes acute, tomentellous on exterior, puberulous within. Petals 5, pubescent. Stamens c. 15, inserted around complete circle; filaments exserted, glabrous, free to base. Ovary villous-tomentose. Style villous. Fruit ovoid, 4-5 cm long; exocarp smooth, glabrous.

DESCRIPTION

Leaf: shape elliptic; **indumentum** glabrous; **petiole gland(s)** absent. **Inflorescence:** type panicle. **Flower:** stamen number exserted/16 - 25; **pedicel** pedicellate; **receptacle** campanulate/cupuliform. **Fruit:** **epicarp** glabrous.

ADDITIONAL DESCRIPTION

Trees. Branches glabrous when young, not lenticellate. Leaves: stipules minute, subulate, glabrous, persistent, axillary; petioles 6-10 mm long, terete or weakly canaliculate, glabrous, eglandular; lamina elliptic, coriaceous, 9-15 × 4-7 cm, acuminate at apex with acumen 4-10 mm long, rounded at base, glabrous on both surfaces; sparsely glandular and with 2 glands towards base on lower surface; midrib prominent and glabrous above; primary veins 9-11 pairs, slightly prominent on both surfaces. Inflorescences terminal and subterminal panicles; rachis and branches sparsely puberulous. Bracts and bracteoles 0.3-0.8 mm long, puberulous, caducous. Flowers 3-3.5 mm long. Receptacle campanulate-cupuliform, brownpuberulous on exterior, tomentose within, pedicels 0.5-1 mm long. Calyx lobes acute, puberulous on both surfaces. Petals 5, sparsely pubescent. Stamens 16-25, inserted around complete circle; filaments far exserted, free to base, glabrous. Ovary pilose-tomentose. Style pilose. Fruit ovoid, c. 11 × 9 cm; exocarp glabrous, drying uneven and knobby, 4-6 mm thick; endocarp thin, c. 1 mm thick, with fibrous exterior, glabrous within.

DESCRIPTION

Leaf: shape oblong/oblong-elliptic; **indumentum** glabrous; **petiole gland(s)** absent. **Inflorescence:** type panicle/racemose.

Flower: stamen number exserted/35; **pedicel** pedicellate; **receptacle** cupuliform. **Fruit:** **epicarp** glabrous/smooth.

ADDITIONAL DESCRIPTION

Tree to 15 m tall. Branches glabrous when young, inconspicuously lenticellate. Leaves with stipules caducous (not seen); petioles 5-7 mm long, canaliculate, glabrous, eglandular; lamina oblong-elliptic to oblong, coriaceous, 7-18 × 2-5.5 cm, with finely pointed apical acumen 8-22 mm long, cuneate to subcuneate at base, glabrous on both surfaces; palisade glands sparsely distributed on lower surface, especially towards lamina base; midrib prominulous above, glabrous; primary veins 8-12 pairs, prominulous beneath, plane above. Inflorescences terminal and axillary racemose panicles; rachis and branches with only a few short hairs otherwise glabrous. Flowers 4-6 mm long, on primary and secondary branches of inflorescence. Bracts and bracteoles 1-4 mm long, caducous. Receptacle cupuliform, almost glabrous on exterior, densely lanate within; pedicels 1-3 mm long. Calyx lobes glabrous or sparsely puberulent, acute; margins ciliolate. Petals 5; margins ciliolate. Stamens c. 35, inserted in a complete circle; filaments far exceeding calyx lobes, glabrous, free almost to base. Ovary villous. Style equalling filaments with lower portion densely lanate. Fruit oblong to globose, to 5 cm diameter; epicarp smooth and glabrous, drying black; mesocarp thin, fleshy, fibrous; endocarp thin, fragile, glabrous within.

Has as synonym

basionym *Licania longipedicellata* Ducke

DESCRIPTION

Leaf: shape oblong/linear; **indumentum** glabrous; **petiole gland(s)** absent. **Inflorescence:** type panicle. **Flower:** stamen number exserted/35 - 45; **pedicel** pedicellate; **receptacle** cupuliform. **Fruit:** epicarp unknown.

ADDITIONAL DESCRIPTION

Trees. Branches glabrous when young. Leaves: stipules linear, to 20 mm long, membranous, glabrous, subpersistent, intrapetiolar; petioles 7-10 mm long, glabrous, eglandular, terete; lamina oblong-linear, coriaceous, 16-33 × 5-12 cm, cuspidate-acuminate at apex with acumen 15-25 mm long, rounded at base, glabrous on both surfaces; palisade glands absent; midrib prominulous above, glabrous; primary veins 13-17 pairs, prominent beneath, plane or nearly so above. Inflorescences terminal panicles; rachis and branches short-puberulous. Flowers 6-7 mm long, in clusters on primary and secondary branches of inflorescence. Bracts at base of branches ovate, to 6 mm long; other bracts and bracteoles ovate, to 3.5 mm long, persistent, puberulous on exterior. Receptacle cupuliform, sericeousvelutinous on exterior, tomentellous within, with a mass of lanate hairs around throat; pedicels 3-7 mm long, with 2-3 mm below articulation. Calyx lobes acute, sericeoustomentose on both surfaces. Petals 5, puberulous, white. Stamens 35-45, inserted in a complete circle; filaments free to base, glabrous, far exceeding calyx lobes. Ovary lanate. Style lanate for 1/2 of length, equaling the filaments. Fruit unknown.

DESCRIPTION

Leaf: shape elliptic/oblong-elliptic; **indumentum** glabrous; **petiole gland(s)** present. **Inflorescence:** type panicle/racemose. **Flower:** **stamen number** exserted/14; **pedicel** sessile/subsessile; **receptacle** campanulate. **Fruit:** **epicarp** glabrous/smooth.

ADDITIONAL DESCRIPTION

Tree, large. Branches glabrescent when young, lenticellate. Leaves with stipules lanceolate, c. 3 mm long, axillary, membranous, persistent; petioles 3-5 mm long, terete, glabrous, rugose, with 2 glands on upper surface; lamina oblong-elliptic to elliptic, coriaceous, 8-16 × 3-6.5 cm, acuminate at apex with acumen 5-15 mm long, rounded to subcuneate at base, glabrous on both surfaces, with scattered glands beneath; midrib slightly prominent and glabrous above; primary veins 9-12 pairs, prominent beneath, prominulus above. Inflorescences of terminal and subterminal racemose panicles; rachis and branches puberulous. Bracts and bracteoles 0.3-1 mm long, ovate, persistent, puberulous on exterior. Receptacle campanulate, subsessile, grey-tomentellous on exterior, densely villous-tomentose within; pedicels 0-0.25 mm long. Calyx lobes acute, tomentellous on both surfaces. Petals 5, pubescent, unguiculate, persistent, exceeding calyx lobes. Stamens c. 14, inserted around complete circle; filaments glabrous, slightly exserted beyond calyx lobes, connate at base. Ovary glabrescent. Style sparsely hirsute. Fruit narrowly ellipsoid, 6-7 × 1-1.5 cm; exocarp smooth, glabrous; mesocarp thin, fleshy; endocarp thin, hard, bony, sparsely puberulous within.

DESCRIPTION

Leaf: shape oblong-elliptic; **indumentum** glabrous; **petiole gland(s)** present/absent. **Inflorescence:** type panicle. **Flower:** **stamen number** exserted/14 - 21; **pedicel** subsessile; **receptacle** campanulate/cupuliform. **Fruit:** **epicarp** glabrous/verrucose.

ADDITIONAL DESCRIPTION

Tree to 45 m tall. Branches glabrous when young.

Leaves: stipules ovate, 1.5 mm long, persistent, axillary; petioles 6-11 mm long, tomentose when young, glandular or eglandular, terete; lamina ovate to oblong-elliptic, coriaceous, 5.5-11 × 2-6 cm, apiculate-acuminate at apex with acumen 1-6 cm long, rounded to subcuneate at base, glabrous on both surfaces, usually without palisade glands; midrib prominulous above, sparsely pubescent when young; primary veins 8-13 pairs, prominulous beneath. Inflorescences spreading terminal and subterminal panicles; rachis and branches brown-tomentose. Bracts and bracteoles 0.2-1 mm long, caducous, tomentose on exterior. Flowers c. 2 mm long, solitary or in small groups on primary branches of inflorescence.

Receptacle campanulate-cupuliform, densely brown-tomentose on exterior, tomentose within; pedicels c. 1 mm long. Calyx lobes acute, tomentose on both surfaces. Petals 4 or 5, creamwhite, sparsely pubescent. Stamens 14-21, inserted in a complete circle; filaments far exceeding calyx lobes, slightly connate at base. Ovary lanate. Style hirsute almost to apex, equalling or exceeding filaments. Fruit ellipsoid, 3.5-4.5 cm long; epicarp minutely lenticellate, glabrous; mesocarp thick, fibrous; endocarp thin, hard, glabrous within.

Moquilea salzmannii Hook.f.

Has as synonym

homotype *Licania salzmannii* (Hook.f.) Fritsch

DESCRIPTION

Leaf: shape elliptic; **indumentum** glabrous; **petiole gland(s)** absent. **Inflorescence:** type panicle/racemose. **Flower:** stamen number exserted/20 - 25; **pedicel** pedicellate; **receptacle** cupuliform. **Fruit:** epicarp glabrous.

ADDITIONAL DESCRIPTION

Tree. Branches glabrous when young, conspicuously lenticellate. Leaves with stipules caducous (not seen); petioles 5-6 mm long, glabrous, canaliculate, eglandular; lamina elliptic, coriaceous, 5-10 × 2-4.5 cm, acuminate at apex, subcuneate at base, shining and glabrous above; palisade glands absent; midrib prominulous and glabrous above; primary veins 9-11 pairs, inconspicuous on both surfaces. Inflorescences terminal and axillary racemose panicles; rachis and branches sparsely appressed-puberulous. Bracts and bracteoles minute, linear, caducous. Flowers 2.5-3 mm long, solitary on primary branches of inflorescence. Receptacle cupuliform, exterior and interior sparsely puberulous; pedicels 2-5 mm long. Calyx lobes acute, narrow, puberulous on both surfaces. Petals 5, sparsely puberulous. Stamens 20-25, inserted in a complete circle; filaments exserted beyond calyx lobes, free almost to base. Ovary lanate. Style lanate at base only. Fruit ovoid, 10.5 × 5.7 cm; exocarp glabrous and densely lenticellate; mesocarp 6-7 mm thick; endocarp c. 1 mm thick, fibrous, glabrous within, filled by a single large seed.

DESCRIPTION

Leaf: shape oblong/lanceolate; **indumentum** glabrous; **petiole gland(s)** present. **Inflorescence:** type panicle. **Flower:** stamen number equal/25; **pedicel** sessile; **receptacle** cupuliform. **Fruit:** epicarp unknown.

ADDITIONAL DESCRIPTION

Tree. Branches tomentose when young, glabrescent. Leaves: stipules linear, 8-12 mm long, membranous, axillary, subpersistent; petioles 6-9 mm long, tomentose, canaliculate, with 2 glands next to lamina beneath; lamina oblong to oblong-lanceolate, coriaceous, 6-10 × 2.2-3.5 cm, acuminate at apex with acumen 5-8 mm long, rounded at base, glabrous on both surfaces with sparse glands beneath; midrib plane and glabrous above; primary veins 11-14 pairs, slightly prominent beneath, impressed above. Inflorescences of terminal panicles; rachis and branches grey-brown tomentose. Flowers c. 2 mm long. Bracts and bracteoles small, ovate-lanceolate, persistent, tomentellous on exterior. Receptacle cupuliform, sessile, tomentose on exterior, villous-tomentose within. Calyx lobes acute, tomentose on both surfaces. Petals 5, puberulous. Stamens c. 25, inserted around complete circle; filaments glabrous, connate at base, equalling calyx lobes. Ovary villous-pubescent. Style villous, equalling calyx lobes. Fruit not seen.

DESCRIPTION

Leaf: shape oblong/oblong-elliptic/lanceolate; **indumentum** glabrous; **petiole gland(s)** present. **Inflorescence:** type panicle/raceme/racemose. **Flower:** **stamen number** exserted/30; **pedicel** pedicellate; **receptacle** campanulate. **Fruit:** **epicarp** glabrous/smooth.

ADDITIONAL DESCRIPTION

Tree to 20 m tall. Branches lanate-tomentose when young, soon becoming glabrous. Leaves: stipules caducous, linear, membranous, axillary; petioles 4-6 mm long, lanate when young, becoming glabrous with age, with 2 glands, shallowly canaliculate; lamina oblong-elliptic to oblong-lanceolate, chartaceous, 4.5-12 × 1.5-4.5 cm, apiculate-acuminate at apex with acumen 2-4 mm long, cuneate to subcuneate at base, farinaceous-lanate on both surfaces when young, becoming glabrous with age; lamina base with 2 glands, but other palisade glands absent; midrib prominulous above, lanate-pubescent when young; primary veins 7-10 pairs, thin, prominulous beneath, level or nearly so and inconspicuous above. Inflorescences little-branched racemose panicles or racemes, predominantly axillary; rachis sparsely grey-tomentose. Flowers c. 3 mm long, solitary but densely crowded along rachis. Receptacle campanulate, sparsely grey-tomentose on exterior, tomentose within; pedicels 1-2 mm long. Calyx lobes acute, tomentellous on exterior, puberulous within. Petals 5, almost glabrous, with ciliate margins. Stamens c. 30, inserted in a complete circle; filaments far exceeding calyx lobes, slightly connate at base. Ovary lanate. Style hirsute most of its length, equaling or exceeding filaments. Fruit oblong; epicarp smooth, drying black; pericarp thick, fragile, fibrous, glabrous within.

COMMENTS

This species is extensively cultivated throughout Brazil as a street tree.

DESCRIPTION

Leaf: shape elliptic; **indumentum** glabrous; **petiole gland(s)** present. **Inflorescence:** type panicle/racemose. **Flower:** **stamen number** exserted/14; **pedicel** pedicellate; **receptacle** campanulate. **Fruit:** **epicarp** glabrous/smooth.

ADDITIONAL DESCRIPTION

Trees. Branches puberulous soon becoming glabrous when young, lenticellate. Leaves: stipules lanceolate 2-4 mm long, axillary, membranous, persistent; petioles 2-5 mm long, terete, glabrous, rugose, with 2 glands on upper surface; lamina ovate to elliptic, coriaceous, 5.5-16 × 3.5-6.8 cm, acuminate at apex with acumen 3-15 mm long, rounded to subcuneate at base, glabrous on both surfaces, with scattered glands beneath; midrib prominent and glabrous above; primary veins 7-10 pairs, prominent beneath, slightly prominent above. Inflorescences terminal and subterminal racemose panicles; rachis and branches puberulous. Bracts and bracteoles 0.3-1 mm long, elliptic, persistent, puberulous on exterior. Flowers 5-6 mm long. Receptacle campanulate, tomentellous on exterior, densely villous-tomentose within; pedicels 2-2.5 mm long. Calyx lobes acute, tomentellous on both surfaces. Petals 5, pubescent, unguiculate, persistent, exceeding calyx lobes. Stamens c. 14, inserted around complete circle; filaments slightly exserted beyond calyx lobes, glabrous, connate at base. Ovary villous-tomentose. Style hirsute to apex. Fruit elongate-cylindrical; exocarp smooth, glabrous; pericarp fibrous, glabrous within.

DESCRIPTION

Árvores, frequentemente emergentes, troncos aéreos ou subterrâneos, lenhosos, bases digitadas ou retas, com ou sem sapopemas; ritudomas escamosos, lenticelados ou reticulados; casca interna avermelhada; ramos jovens pilosos, glabrescentes ou glabros, lenticelados, catáfilos caducos, raramente persistentes. Folhas alternas, inteiras, dísticas; lâminas foliares com margem plana ou revoluta, cartáceas ou coriáceas; face abaxial com nervuras proeminentes, criptas estomáticas cobertas por tricomas simples presentes ou ausentes, araqueídeos, frequentemente com nectários discóides ao longo de toda a margem; face adaxial lustrosa, levemente pilosa quando jovem, glabrescente quando madura; pecíolo com um par de nectários sésseis na região mediana ou próximo a lâmina foliar, nectários ausentes ou raro dois; estípulas laterais ao pecíolo finas, semelhantes aos catáfilos, precocemente caducas. Inflorescências em tirso provenientes de gemas laterais, castanhas, pilosas ou velutinas, paracládios dispostos em cimas simples ou compostas; brácteas de primeira e segunda ordem eglandulares, convexas, castanhas, tomentosas e pilosas, precocemente caducas. Flores bissexuais, ligeiramente zigomorfas; receptáculos maiores que as sépalas, campanulados, infundibuliformes ou ligeiramente gibosos, ligeiramente volumoso em um dos lados, esverdeados a castanhos, tricomas acastanhados in vivo, densamente vilosos internamente; sépalas 5-mera, castanhas ou esverdeadas, densamente pilosas em ambas as superfícies, frequentemente reflexas, ápice agudo; pétalas 5-mera, alvas ou rosadas, caducas, margem ciliada; estames 6–10, dispostos em semicírculo, opostos ao ovário, ligeiramente curvados, inclusos; filetes livres, alvos, largos na base, glabros; estaminódios 7, opostos aos estames; ovário unicarpelar, bilocular, inserido na parte lateral superior do receptáculo; estilete inclusivo, filiforme. Drupas fibrosas, epicarpo verrucoso e lenticulado, mesocarpo frequentemente verde, endocarpo espesso, fibroso e coberto por um denso indumento araqueídeo, com duas obturações basais. Sementes elípticas, retas, enrijecidas. Germinação hipógea

COMMENTS

O gênero possui distribuição Pantrropical, abriga 39 espécies e apresenta dois centros de diversidade, a região neotropical com 19 espécies e o sul da Ásia com 15 espécies. As florestas tropicais úmidas concentram a maior riqueza no gênero, com seus representantes possuindo em sua maioria hábito arbóreo emergente, embora algumas espécies que ocorrem em vegetações abertas e apresentam adaptações no habitat nesses ambientes como caules subterrâneos espessos.

Morfologicamente *Parinari* é reconhecido pela presença de duas glândulas no pecíolo e ao longo da margem da lâmina foliar, criptas estomáticas na face abaxial da lâmina foliar recobertas por tricomas, brácteas em grupos envolvendo as flores, receptáculo subcampanulado, corola alva, raramente rósea, estames 6-8, ovário bilocular inserido na porção superior do receptáculo, fruto com epicarpo verrucoso e endocarpo com duas pequenas obturações. *Parinari* é considerado um gênero de complexa taxonomia, especialmente devido à pouca variação morfológica observada nas flores e frutos) e também pela existência de vários complexos de espécies

Parinari occidentalis Prance

DESCRIPTION

Stem: branch aerial. **Leaf:** stipule caducous; length of the stipule below of the 2 cm; nectary extrafloral absent node petiole/on the region median of the petiole; leaf ovate/elliptic; base of the leaf cuneate/rounded; nectary extrafloral on the margin of the side abaxial frequently present; acumen to 5 mm; distance between to the veins secondary 3 to 5.5 mm; margin of the leaf flat. **Inflorescence:** inflorescence terminal/lateral. **Flower:** hypanthium smaller than 6 mm. **Fruit:** fruit elliptic/obovate.

Parinari rodolphii Huber

Has as synonym

heterotypic *Parinari lucidissima* Standl.

DESCRIPTION

Stem: branch aerial. **Leaf:** stipule persistent; **length of the stipule** 5 to 40 mm; **nectary extrafloral** on the region median of the petiole; **leaf** elliptic/oblong; **base of the leaf** cuneate/rounded; **nectary extrafloral on the margin of the side abaxial** frequently present; **acumen** 9 to 12 mm; **distance between to the veins secondary** 1 to 3; **margin of the leaf** strongly revolute. **Inflorescence:** inflorescence terminal. **Flower:** hypanthium smaller than 6 mm. **Fruit:** fruit obovate.

Parinariopsis (Huber) Sothers & Prance

This treatment is composed of the following taxa: *Parinariopsis*, *Parinariopsis licaniflora*.

HOW TO CITE

Sothers, C.A., Prance, G.T. 2020. *Parinariopsis* in **Flora do Brasil 2020**. Jardim Botânico do Rio de Janeiro. Available at: <http://floradobrasil.jbrj.gov.br/reflora/floradobrasil/FB604708>.

DESCRIPTION

Trees. Leaves: stipules caducous, axillary; petioles usually with 2 prominent glands, sometimes eglandular or glands near lamina base; lamina obovate, elliptic to oblong, coriaceous; lower surface conspicuously reticulate and lanate, with ±parallel secondary veins. Inflorescences terminal panicles. Bracts and bracteoles enclosing small groups of flower buds. Flowers bisexual, zygomorphic, densely disposed along primary and secondary branches of inflorescence. Receptacle campanulate, slightly tapered at base but sessile. Sepals 5. Petals 5. Stamens 16-25 inserted in a complete circle; filaments slightly exserted, free nearly to base; staminodes absent. Ovary 1-carpellary, 1-locular, inserted laterally at side of base of receptacle. Style equaling filaments. Fruit a drupe; epicarp lenticellate; mesocarp thick; endocarp thin, hard, fibrous, glabrous within; without any special mechanisms for seedling escape.

COMMENTS

A monospecific genus widespread in the Amazonia. Occurs in open forest at river margins, savanna margins and in secondary forest.

DESCRIPTION

Trees to 30 m tall. Branches hispid-puberulous when young, soon becoming glabrous and conspicuously lenticellate. Leaves: stipules to 13 mm long, ovate, membranous, caducous, axillary; petioles 7-20 mm long, terete, strigose-puberulous, eventually glabrous, usually with 2 prominent medial glands, sometimes eglandular or glands near lamina base; lamina obovate, elliptic to oblong, coriaceous, 5-23 × 2.5-10 cm, apiculate to mucronate at apex with acumen 0-5 mm long, glabrous above, conspicuously reticulate on lower surface with ±parallel secondary veins; veins appressed-strigose with intervening spaces grey-lanate pubescent; midrib impressed its entire length above, glabrous except when young; primary veins 8-17 pairs, prominent beneath, impressed above. Inflorescences spreading terminal panicles; rachis and branches tomentellous. Flowers 5-6 mm long, densely disposed along primary and secondary branches of inflorescence. Bracts and bracteoles 3-6 mm long, triangular, enclosing small groups of flowers, tomentellous on exterior, glabrescent within. Receptacle campanulate, slightly tapered at base but sessile, tomentose on exterior and within. Calyx lobes acute, tomentellous on both surfaces. Petals 5, oblong, short-clawed, puberulous on exterior. Stamens 18-25, inserted in a complete circle; filaments slightly exceeding calyx lobes, free nearly to base, hirsutulous. Ovary inserted laterally at the side of receptacle, villous. Style equalling filaments, pubescent throughout. Fruit oblong, 6-8 cm long, 3-4.5 cm broad, stipitate when young, becoming sessile by expansion of the stipe; epicarp covered with large conspicuous lenticels; mesocarp thick; endocarp thin, hard, fibrous, glabrous within.
